

1 **Q. Please state your name, business address and present position with**  
2 **PacifiCorp dba Rocky Mountain Power (“the Company”).**

3 A. My name is Joelle R. Steward. My business address is 825 NE Multnomah Street,  
4 Suite 2000, Portland, Oregon 97232. My present position is Director of Pricing,  
5 Cost of Service, and Regulatory Operations in the Regulation Department.

6 **Qualifications**

7 **Q. Please briefly describe your education and business experience.**

8 A. I have a Bachelor of Arts degree in Political Science from the University of  
9 Oregon and a Masters of Public Affairs from the Hubert Humphrey Institute of  
10 Public Policy at the University of Minnesota. Between 1999 and March 2007,  
11 I was employed as a Regulatory Analyst with the Washington Utilities and  
12 Transportation Commission. I joined the Company in March 2007 as the  
13 Regulatory Manager responsible for all regulatory filings and proceedings in  
14 Oregon. I assumed my current position in February 2012, in which I direct the  
15 work of the cost of service, pricing, and regulatory operations groups.

16 **Q. What are your responsibilities?**

17 A. I am responsible for regulated retail rates, cost of service analysis, and regulatory  
18 filings and documentation in the Company’s six state service territory.

19 **Q. Have you appeared as a witness in previous regulatory proceedings?**

20 A. Yes. I have testified in regulatory proceedings in Idaho, Oregon, Utah, Wyoming,  
21 and Washington.

22 **Purpose of Testimony**

23 **Q. What is the purpose of your testimony?**

24 A. I present the Company's functionalized class cost of service ("COS") study based  
25 on the 12 month forecast test period ending June 30, 2015. I also address the  
26 Company's proposed rate spread and rate changes for the affected rate schedules.

27 **Q. How is your testimony organized?**

28 A. My testimony is organized as follows:

- 29 • First, I present the results of the COS study, including a description of  
30 changes in the COS since the last general rate case in Docket No. 11-035-200,  
31 and procedures used in the preparation of the study.
- 32 • Second, I present the Company's proposed rate spread, which is the allocation  
33 of the rate increase to the major customer rate schedules.
- 34 • Third, I describe and present the Company's proposed rate changes for the  
35 major customer rate schedules.
- 36 • Next, I describe and present the Company's proposed Net Metering Facilities  
37 Charge for residential net metering customers on Schedule 135.
- 38 • Lastly, I present the Company's proposal for a 15 percent increase to the Low  
39 Income Lifeline Credit.

40 **Q. What are the Company's objectives in this case in regards to allocating costs  
41 and designing rates?**

42 A. The Company's objectives in this case are to implement the proposed rate  
43 increase while reflecting cost causation, equity, economic efficiency, revenue  
44 adequacy, and minimizing customer impacts. As noted in the Direct Testimony of

45 Mr. A. Richard Walje, the growth of customer generation and declining usage per  
46 customer present challenges to several of these objectives. To address these  
47 challenges the Company believes it is necessary to confront the current  
48 inconsistency between rate design and the capital-intensive nature of electric  
49 utilities, i.e., the fixed infrastructure that is necessary for customers to take service  
50 regardless of usage. As discussed later in my testimony, I present proposals that  
51 recognize this changing nature of the industry and help achieve the objectives  
52 noted above.

### 53 **Class Cost of Service Study**

54 **Q. What are the results from the COS study?**

55 A. Exhibit RMP\_\_\_(JRS-1) shows the summary of results from the embedded COS  
56 study for the State of Utah. It is based on the Company's revenue requirement  
57 presented in the testimony and exhibits of Mr. Steven R. McDougal. It  
58 summarizes, both by customer group and function, the results of the class cost of  
59 service study for the 12 months ending June 30, 2015. Page 1 of Exhibit  
60 RMP\_\_\_(JRS-1) presents results at the Company's June 2013 rate of return  
61 assuming current rate levels. Page 2 shows results using the target rate of return  
62 based on the requested \$76.3 million revenue requirement increase.

63 Exhibit RMP\_\_\_(JRS-2) shows the cost of service results in more detail  
64 by class and by function. Page 1 summarizes the total COS summary by class;  
65 pages 2 through 6 contain a summary by class for each major function; pages 7  
66 through 9 contain a summary by class and major function on a unit cost basis.

67 The complete functionalized results of operations and embedded class cost

68 of service detail are included as Exhibit RMP\_\_\_\_(JRS-3). Also included is a  
69 detailed narrative describing the Company’s functionalization, classification and  
70 allocation procedures.

71 **Changes in Cost of Service Study**

72 **Q. Are there any differences between this COS study and the study filed with**  
73 **the Utah Public Service Commission (“Commission”) in Docket No. 11-035-**  
74 **200?**

75 A. Yes. The Company has incorporated changes in response to the questions raised  
76 regarding consistency between the Company’s jurisdictional allocation model  
77 (“JAM”) and COS study. In the Commission’s May 17, 2012 action request in  
78 Docket No. 11-035-200, the Commission asked the Division of Public Utilities  
79 (“DPU”) to investigate the following three items for inconsistencies between the  
80 JAM and COS models:

- 81 • Relations among cash working capital, interest expense, and income taxes.
- 82 • Determination of state income taxes.
- 83 • Use of the income to revenue multiplier.

84 A technical conference was held with interested parties on June 4, 2012 to discuss  
85 the questions in the action request, along with a follow-up settlement telephone  
86 conference on June 18, 2012. Based on these discussions and its investigation,  
87 DPU recommended that the Company modify the class COS study to be  
88 consistent with the JAM on these items.<sup>1</sup> Consistent with this recommendation,  
89 the Company has modified the COS model to treat the three items noted above in  
90 a manner consistent with the JAM.

---

<sup>1</sup>See Docket No. 11-035-200, Pre-filed Direct Testimony for Mr. Artie Powell, June 22, 2012, p. 35.

91 **Description of Cost of Service Study Procedures**

92 **Q. Please explain how the COS study was developed.**

93 A. The COS study uses the results from Mr. McDougal's Exhibit RMP\_\_\_(SRM-3)  
94 and employs a three-step process referred to as functionalization, classification,  
95 and allocation. These three steps recognize the way a utility provides electrical  
96 service and assigns cost responsibility to the groups of customers for whom those  
97 costs were incurred.

98 **Q. Please describe functionalization and how it is employed in the COS study.**

99 A. Functionalization is the process of separating expenses and rate base items  
100 according to five utility functions--production, transmission, distribution, retail  
101 and miscellaneous.

102 • The production function consists of the costs associated with power  
103 generation, including coal mining, and wholesale purchases.

104 • The transmission function includes the costs associated with the high voltage  
105 system utilized for the bulk transmission of power from the generation source  
106 to the load centers.

107 • The distribution function includes the costs associated with all the facilities  
108 that are necessary to connect individual customers to the transmission system.  
109 This includes distribution substations, poles and wires, line transformers,  
110 service drops and meters.

111 • The retail services function includes the costs of meter reading, billing,  
112 collections and customer service.

113 • The miscellaneous function includes costs associated with demand-side

114 management, franchise taxes, regulatory expenses, and other miscellaneous  
115 expenses.

116 **Q. Describe classification and explain how it is used by the Company in the COS**  
117 **study.**

118 A. Classification identifies the component of utility service being provided. The  
119 Company provides and customers purchase service that includes at least three  
120 different cost components: demand-related, energy-related, and customer-related.  
121 Demand-related costs are incurred by the Company to meet the maximum  
122 demand imposed on generating units, transmission lines, and distribution  
123 facilities. Energy-related costs vary with the output of a kWh of electricity.  
124 Customer-related costs are driven by the number of customers served.

125 **Q. How does PacifiCorp determine cost responsibility between customer**  
126 **groups?**

127 A. After the costs have been functionalized and classified, the next step is to allocate  
128 them among the customer classes or rate schedules. This is achieved by using  
129 allocation factors that specify each class' share of a particular cost driver such as  
130 system peak demand, energy consumed, or number of customers. The appropriate  
131 allocation factor is then applied to the respective cost element to determine each  
132 class' share of cost. A detailed description of the Company's functionalization,  
133 classification and allocation procedures and the supporting calculations for the  
134 allocation factors is contained in my workpapers. To the extent possible and  
135 consistent with prior Commission direction, the COS study treats and allocates  
136 costs among customer classes on a consistent basis with the way the Company's

137 shared system costs are allocated to each state in the jurisdictional allocation  
138 model.

139 **Q. How are generation and transmission costs apportioned among customer**  
140 **classes?**

141 A. The Company classifies production and transmission plant and non-fuel expenses  
142 as 75 percent demand-related and 25 percent energy-related. The demand-related  
143 portion is allocated using 12-monthly peaks coincident with the Company's total  
144 system firm peak. The energy-related portion is allocated using annual class MWh  
145 adjusted for losses at the generation level.

146 **Q. How are distribution costs classified and allocated?**

147 A. Distribution costs are classified as either demand-related or customer-related. In  
148 this study, only meters and services are considered customer-related with all other  
149 costs considered demand-related. Distribution substations and primary lines are  
150 allocated using the weighted monthly coincident distribution peaks. Distribution  
151 line transformers and secondary lines are allocated using the weighted non-  
152 coincidental peak method. The meter allocation factor is developed using the  
153 installed costs of new metering equipment for different types of customers.

154 **Q. Please explain how customer accounting, customer service, and sales**  
155 **expenses are allocated.**

156 A. Customer accounting expenses are allocated to classes using weighted customer  
157 factors. The weightings reflect the resources required to perform such activities as  
158 meter reading, billing, and collections for different types of customers. Customer  
159 service expenses are allocated on the number of customers in each class.

160 **Q. How are administrative & general expenses, general plant and intangible**  
161 **plant allocated?**

162 A. Most general plant, intangible plant, and administrative and general expenses are  
163 functionalized and allocated to classes based on generation, transmission, and  
164 distribution plant. Costs that have been identified as supporting customer systems  
165 are considered part of the retail services function and have been allocated using  
166 customer factors. Coal mine plant costs are allocated using the energy factor.

167 **Q. How has the Company reflected the allocation of the deferred depreciation**  
168 **expense, pursuant to paragraph 45 in the Stipulation in Docket No. 11-035-**  
169 **200?**

170 A. The deferred depreciation expense in Account 407, which is explained in Mr.  
171 McDougal's testimony, has been allocated on factor F151. This factor is derived  
172 from total depreciation expenses for each customer rate schedule.

173 **Q. How are costs and revenues associated with wholesale contracts and other**  
174 **electric revenues treated in the COS study?**

175 A. No costs are assigned to wholesale contracts and other electric revenues. The  
176 revenues from these transactions are treated as revenue credits and are allocated to  
177 customer groups using appropriate allocation factors. Revenue credits reduce the  
178 revenue requirement that is to be collected from firm retail customers. This is  
179 consistent with treatment of these revenues in the inter-jurisdictional results of  
180 operations.

181 **Q. Have you included cost of service results for the Utah special contracts?**

182 A. Yes. Consistent with the 2010 Protocol, the loads and revenues associated with

183 service to special contract customers are included as part of the jurisdictional  
184 allocation and included in the revenue requirement. The loads and revenues for  
185 special contract customers are also included in the COS study.

186 **Q. Does the COS study include results for partial requirements, back-up service**  
187 **and electric furnace customers?**

188 A. No. Cost of service results were not calculated for these categories of customers,  
189 which include one special contract customer and those customers taking service  
190 on Schedule 21 and Schedule 31.

191 **Q. Why are these customers removed from the COS study?**

192 A. Partial requirements service and electric furnace customers are not included in the  
193 embedded COS study because they do not lend themselves well to this type of  
194 analysis. These customers usually have very sporadic loads from year-to-year  
195 producing volatile cost of service results depending on whether or not service is  
196 required during the hour of monthly system peak. It is the Company's practice to  
197 derive prices for partial requirements service from the prices and costs for full  
198 requirements service.

#### 199 **Proposed Allocation of Revenue Requirement Increase to Customer Classes**

200 **Q. How does the Company propose to allocate the increase across customer**  
201 **classes?**

202 A. The Company proposes to rely on the results of the COS study at the target return  
203 on rate base (Exhibit RMP\_\_\_\_(JRS-1, page 2 of 2) to guide the allocation of the  
204 rate increase to tariff customers.

205 **Q. Please describe Exhibit RMP\_\_\_(JRS-4).**

206 A. Exhibit RMP\_\_\_(JRS-4) details the Company's proposed changes to class  
207 revenues to be implemented in this case. Based on the forecast 12 month test  
208 period ending June 2015, this proposal would result in an overall increase of 4.0  
209 percent to tariff customers in Utah.

210 **Q. Please describe the Company's proposal for the allocation of the revenue**  
211 **requirement.**

212 A. The Company proposes the following allocation of the rate increase for the major  
213 customer classes.

<u>Customer Class</u>	<u>Proposed Rate Change</u>
Residential	5.1%
General Service	
Schedule 23	3.1%
Schedule 6	2.1%
Schedule 8	4.1%
Schedule 9	6.1%
Irrigation	6.1%

214 **Q. Please explain the proposed rate spread.**

215 A. The proposed rate spread is designed to reflect cost of service results while  
216 balancing the impact of the rate change across customer classes. In order to  
217 achieve the revenue requirement target, the proposed rate spread midpoint was set  
218 at 4.1 percent. The midpoint is set based on the revenue increase to the rate  
219 schedules to which the proposed increase is being applied.

220           The Company proposes the rate spread midpoint amount for Schedule 8  
221 customers based on their cost of service results which are less than two  
222 percentage points from the rate spread midpoint.

223           For residential customers, the cost of service results indicate that they

224 should receive an increase about four percentage points more than the rate spread  
225 midpoint. Based on these results, the Company proposes an increase one  
226 percentage point more than the rate spread midpoint, roughly one-fourth of their  
227 cost of service percentage difference from the rate spread midpoint.

228 For Schedule 6, the cost of service results indicate that they should receive  
229 an increase about eight percentage points less than the rate spread midpoint.  
230 Based on these results, the Company proposes an increase two percentage points  
231 less than the rate spread midpoint, roughly one-fourth of their cost of service  
232 percentage difference from the rate spread midpoint.

233 For Schedule 23, the cost of service results indicate that they should  
234 receive an increase about five percentage points less than the rate spread  
235 midpoint. Based on these results, the Company proposes an increase one  
236 percentage point less than the rate spread midpoint, or roughly one-fourth of the  
237 cost of service percentage difference from the rate spread midpoint.

238 For Schedule 9 and Schedule 10, the cost of service results indicate that  
239 they should receive an increase about seven to eight percentage points more than  
240 the rate spread midpoint respectively. Based on these results, the Company  
241 proposes an increase two percentage points higher than the rate spread midpoint,  
242 or roughly one-fourth of the cost of service percentage difference from the rate  
243 spread midpoint.

244 For the public streetlighting schedules, based on the cost of service results  
245 the Company is not proposing an increase except for traffic signal systems on  
246 Schedule 15.

247 Overall, the Company believes that the proposed rate spread makes  
248 appropriate movement to cost of service while mitigating customer impacts.

249 **Q. How has the Company treated special contract customer price changes in**  
250 **this case?**

251 A. For Contract 1, the percentage rate change is set at the overall average increase of  
252 4.05 percent for Utah customers, consistent with terms of the contract.

253 For Contract 3, rates are set at Schedule 31/Schedule 9 equivalent rates.  
254 The dollar and percentage rate changes indicated in this case for this customer  
255 reflect their usage at the proposed applicable tariff rates.

256 For Contract 2, its 2014 prices have been calculated per the terms of the  
257 contract and assumed in the present revenues in this case.

## 258 **Residential Rate Design**

259 **Q. What is the Company's proposed residential rate design?**

260 A. The Company proposes to increase the current Customer Charge from \$5.00 to  
261 \$8.00 per month. The Company proposes to collect the balance of the residential  
262 price change through proportional increases to the energy charges. The Company  
263 also proposes to increase the minimum bill for residential customers from \$7.00  
264 per month to \$15.00 per month.

265 **Q. Please provide a brief history of the Company's residential customer charge.**

266 A. In 1985, in Docket No. 84-035-01, the Commission developed a policy regarding  
267 what costs should be included in the residential customer charge. These included  
268 some of the customer-based costs, such as meters, service drops, meter reading,  
269 collections and billing. Under this policy the Company's residential customer

270 charge in Utah has consistently been the lowest of the Company's residential  
271 customer charge across its six state system. It was set at \$1.00 per month in 1985  
272 and is currently \$5.00.

273 **Q. What costs should be reflected in the customer charge?**

274 A. The costs that do not vary with usage are appropriate costs to include in  
275 determining the level of the residential monthly customer charge. Specifically, at  
276 this time the Company proposes that, at a minimum, the customer charge should  
277 be determined by taking into consideration the costs functionalized in the  
278 embedded COS study that are specified as distribution and retail. As shown on  
279 Exhibits RMP \_\_\_(JRS-2) and (JRS-8), the COS study supports a monthly  
280 customer charge of \$25.00 for these costs. This does not include fixed costs  
281 related to transmission and generation, which would increase this amount by an  
282 additional approximate \$31 per month.

283 The distribution function includes the radial system that connects the  
284 customer to the transmission system. This includes distribution substations, poles  
285 and wires, line transformers, service drops and meters. The retail function  
286 includes the retail activities associated with customer service, including meter  
287 reading, customer accounting, and customer service activities.

288 While the COS study supports a much higher customer charge, the  
289 Company is proposing an increase of only \$3.00 in this case, resulting in an \$8.00  
290 monthly customer charge, which is a reasonable and a balanced step that takes  
291 into account the Company's pricing objectives identified earlier. The proposed  
292 residential customer charge is supported by cost, and helps reduce intra-class

293 cross subsidies while minimizing customer bill impacts.

294 **Q. Why is it important that the customer charge recover a significant portion of**  
295 **the fixed costs of serving customers?**

296 A. In today's environment where we encourage reductions in usage where possible  
297 and attempt to achieve efficient usage in all circumstances, it is not appropriate to  
298 achieve the recovery of fixed costs through the variable energy components of  
299 rates. Doing so creates a conflict for the utility and unclear price signals for  
300 customers.

301 For the utility, when recovery of fixed costs is predominantly through  
302 energy rates, as is the case in Utah, the utility has an incentive to sell more kWh  
303 in order to recover its fixed costs and is more dependent on weather and changes  
304 in usage for recovery of these costs; particularly when a steeply inverted tier rate  
305 structure is in place, as in Utah. As discussed in the direct testimony of Ms.  
306 Kelcey A. Brown, the Company has seen a drop in usage per customer, which is  
307 expected to continue in the future as a result of changing demographics and  
308 adoption of more energy efficient technology. This drop in residential usage is a  
309 significant contributor to the requested increase in the case, and in particular to  
310 the residential class.

311 While reduced energy usage will directly influence the need for variable  
312 resources, such as fuel, and potentially slow the need for new infrastructure, a  
313 drop in energy usage results in fewer kWh over which to recover the fixed costs  
314 that have been incurred and are necessary to serve customers. For example,  
315 distribution system components--substations, primary feeders, secondary lines,

316 line transformers, and service drops--are facilities required to provide a residential  
317 customer access to electric service regardless of how much energy is used. The  
318 expenses related to maintenance of these facilities are also necessary in order to  
319 provide reliable service for any energy user, regardless of size. Additionally, retail  
320 service costs, which include the cost of reading meters, answering customer  
321 service phone calls, sending customer statements, processing customer payments,  
322 and providing online access to customers' accounts are clearly unrelated to usage  
323 and are a necessary part of doing business. These costs do not go away when  
324 usage levels decrease, whether the decrease is related to weather, behavioral  
325 changes or the adoption of energy efficient technology.

326 For customers, recovery of a significant portion of fixed costs in  
327 volumetric energy charges distorts price signals and inequitably places a larger  
328 burden of fixed cost recovery on larger users.

329 **Q. Will the proposed increase in the residential customer charge dampen**  
330 **customers' price signals for conservation?**

331 A. No. Even with the proposed increase in the residential customer charge, 90  
332 percent of residential revenue will be recovered through energy rates. This  
333 compares to the cost of service that shows that 30 percent of costs are energy  
334 related. For an average customer using approximate 700 kWh per month, at the  
335 proposed rates 90 percent of the bill is related to energy charges. For a small user  
336 half the size of an average user, 80 percent of the bill is related to energy charges;  
337 and a high user twice the size of an average user will have 95 percent of the bill  
338 related to energy charges. Therefore, all residential customers--and high use

339 customers in particular--will continue to have a strong motivation to conserve or  
340 pursue energy efficient technology.

341 **Q. Why does the Company propose to increase the minimum bill to \$15 for**  
342 **residential customers in this case?**

343 A. The Company had proposed eliminating the minimum bill in the past few general  
344 rate case because the Company believes that the customer charge is the  
345 appropriate mechanism to recover fixed costs. However, the minimum bill has  
346 been supported by both the Office of Consumer Services (“OCS”) and the Salt  
347 Lake Community Action Program (“SLCAP”) on that basis that it helps the  
348 Company recover fixed costs from very low use customers. As a result, the  
349 Company is proposing to retain the minimum bill as a reasonable compromise at  
350 this time for fixed cost recovery from low use customers rather than a higher  
351 customer charge for all residential customers.

352 In the calculation of a minimum bill, volumetric usage is included. At  
353 current rates, the minimum bill is only applied to customers whose monthly usage  
354 is at or below approximately 23 kWh for single phase service, and most customers  
355 never pay a minimum bill. For the most recent historic period available (12 month  
356 period ended June 30, 2013), approximately one percent of all residential  
357 customer bills were minimum bills. The proposed minimum bill of \$15 helps  
358 recover a portion of the fixed costs incurred and necessary to provide service to  
359 very low usage customers.

360 **Q. Does the Company propose any changes to the current optional,**  
361 **experimental residential time of day tariff rider, Schedule 2?**

362 A. The Company proposes no change to both the on-peak charge and the off-peak  
363 credit for the optional, experimental time of day tariff rider for residential  
364 customers.

365 **Low Income Lifeline Credit**

366 **Q. Is the Company proposing to increase the Low Income Lifeline Credit on**  
367 **Schedule 3?**

368 A. Yes. The Company is proposing a \$1.60 increase in the Low Income Lifeline  
369 Credit. This will increase the current credit from \$11.00 per month to \$12.60 per  
370 month, and is shown in Exhibit RMP\_\_\_(JRS-5). Since the credit level has not  
371 been changed since 2009, the Company believes the proposed change to the credit  
372 is reasonable to reflect changes in residential rates over time and the proposed  
373 increase in this case.

374 **Q. How many customers currently receive the Low Income Lifeline Credit?**

375 A. While the number fluctuates monthly, on average approximately 30,000  
376 customers receive the credit.

377 **Q. Is the Company proposing an increase to Schedule 91, Surcharge to Fund**  
378 **Low Income Residential Lifeline Program, at this time?**

379 A. No. Based on the current collection balance for Schedule 91, an increase in the  
380 collection level is not necessary at this time. The Company will continue to  
381 monitor the balance and propose revisions in the future as necessary.

382 **General Service & Irrigation Rates**

383 **Q. Please generally describe the Company's proposed rate design changes for**  
384 **commercial, industrial, and irrigation customers.**

385 A. Consistent with the Company's proposal in recent general rate cases, the  
386 Company does not propose any structural changes to its general service rates.  
387 Generally, the Company proposes to apply a uniform percentage change to the  
388 billing components in each schedule. The proposed rates are in Exhibit  
389 RMP\_\_\_(JRS-5).

390 **Q. What changes does the Company propose for customers on Schedule 6,**  
391 **General Service - Distribution Voltage?**

392 A. The Company proposes to apply the proposed revenue requirement change by  
393 applying a uniform percentage to demand charges and energy charges. We also  
394 propose to increase the Customer Service Charge.

395 **Q. What does the Company propose for Schedule 8, Large General Service -**  
396 **1,000 kW and Over - Distribution Voltage, and Schedule 9, General Service -**  
397 **High Voltage?**

398 A. The Company proposes to increase uniformly the facility, demand and energy  
399 charges to reflect the proposed revenue requirement change. We also propose to  
400 increase the monthly Customer Service Charge for Schedule 8 and Schedule 9.

401 **Q. What does the Company propose for the optional time of use Schedule 9A,**  
402 **General Service - High Voltage Energy Time of Day Option currently in**  
403 **effect?**

404 A. Schedule 9A is closed to new service. These customers have the ability to shift to

405 Schedule 9 if they desire. The Company proposes to increase Schedule 9A  
406 charges consistent with the proposed changes to Schedule 9.

407 **Q. Is the Company proposing changes to Schedule 31, Back-up, Maintenance,**  
408 **and Supplementary Power?**

409 A. The Company has proposed changes to the applicability and methodology for the  
410 calculation of rates in Schedule 31 in Docket No. 13-035-196. The Company is  
411 proposing to implement any changes adopted in that proceeding in the compliance  
412 filing for this general rate case. This filing includes updated proposed Schedule 31  
413 rates consistent with the proposed methodology in Docket No. 13-035-196 and  
414 updated for the proposed revenue requirement increase and rates in this  
415 proceeding.

416 **Q. How does the Company propose to implement the rate change for Schedule**  
417 **23, General Service - Distribution Voltage - Small Customer?**

418 A. The Company proposes to implement the rate change for Schedule 23 uniformly  
419 to demand and energy charges, along with an increase to the Customer Charge.

420 **Q. How does the Company propose to implement the rate change for Schedule**  
421 **10, Irrigation and Soil Drainage Pumping Power Service?**

422 A. The Company proposes to implement the rate change for Schedule 10 uniformly  
423 to demand and energy charges and to increase the Customer Service charges.

424 **Q. How does the Company propose to implement the rate change for lighting**  
425 **customers?**

426 A. Based on the cost of service results, the Company does not propose an increase  
427 for most lighting customers; however, it does propose an increase for traffic

428 signals. For those customers, the Company designed the rate change by applying a  
429 percentage increase to the current rate to achieve the proposed overall revenue  
430 change.

431 **Q. Does the Company propose any tariff revisions to lighting schedules?**

432 A. Yes, the Company proposes to revise the burn hours from 3,940 to 4,167 for non-  
433 listed luminaries in Schedule 12, Street Lighting, Customer-Owned System. The  
434 number of burn hours is an estimate of how long the light burns, and is affected  
435 by a number of factors such as visibility to the horizon, photocell operation, and  
436 latitude and longitude (location). Based on analysis, the Company has determined  
437 that 4,167 burn hours is more accurate than the current 3,940 hours. This results  
438 in an increase of approximately 5.8 percent for these customers.

439 **Q. Are there any other tariff changes that the Company proposes?**

440 A. Yes. The Company proposes to cancel Schedule 14, Temporary Service  
441 Connection Facilities (No New Service). This schedule has been closed to new  
442 service since March 1999 and there are no longer any customers currently taking  
443 service on this schedule.

#### 444 **Billing Determinants**

445 **Q. Please explain Exhibit RMP\_\_\_(JRS-5).**

446 A. Exhibit RMP\_\_\_(JRS-5) contains a summary of present and proposed prices  
447 along with the billing determinants used in preparing the pricing proposals in this  
448 case. In accordance with R746-700-21.D.1, Exhibit RMP\_\_\_(JRS-5) provides in a  
449 readily identifiable form the Company's proposed price changes for all rate  
450 schedules.

451 **Monthly Billing Comparisons**

452 **Q. Has the Company provided estimated monthly bill impacts of its proposed**  
453 **rate changes?**

454 A. Yes. Exhibit RMP\_\_\_\_(JRS-6) details the customer impacts of the Company's  
455 proposed pricing changes. For each rate schedule, it shows the change in monthly  
456 bills for various load and usage levels.

457 **Net Metering Facilities Charge**

458 **Q. What is the Net Metering Facilities Charge that the Company is proposing in**  
459 **this case?**

460 A. The Company is proposing to implement a monthly facilities charge on Schedule  
461 135, Net Metering Service, for residential customers participating in net metering.  
462 The facilities charge is a fixed monthly charge that is in addition to the customer  
463 charge on the applicable electric service schedule. The net metering facilities  
464 charge will recover the fixed distribution and retail costs that are incurred and  
465 necessary to serve net metering customers. For residential customers, the  
466 Company is proposing a Net Metering Facilities Charge of \$4.25 per month.  
467 Exhibit RMP\_\_\_\_(JRS-7) shows the proposed revisions to Schedule 135.

468 **Q. Please explain the net metering program in Utah.**

469 A. Under net metering, customers who install distributed generation facilities can  
470 offset all or part of their electricity requirements and feed back to the electric grid  
471 the electricity the customer's facility generates in excess of the customer's needs  
472 at that moment. During a billing period, any excess customer generation is  
473 credited against customer kWh usage taken from the utility, resulting in a net bill.

474 Any additional kWh generated in excess of customer usage during that billing  
475 period can be carried over into future billing periods to be applied against  
476 customer usage taken from the utility. In effect, under net metering the customer  
477 receives a bill credit for the excess electricity that reflects the full retail rate for  
478 energy. The Company's net metering program in Utah is offered consistent with  
479 Utah Code Ann. § 54-15-101 to 106 and R746-312.

480 The rate at which customers in Utah are choosing to participate in net  
481 metering has been growing dramatically over the last three years; the number of  
482 customers installing facilities and participating in net metering has grown by over  
483 30 percent annually. As of November 30, 2013, there were 2,139 customers  
484 participating in the net metering program. The generation facilities installed by  
485 these participating customers have a total generating capacity of 14,273 kW<sub>DC</sub>.  
486 For 2013 alone, as of November 30, 2013, 592 new customers installed facilities.  
487 This exceeds the total installations (453) in 2012 by over 30 percent. With the  
488 continued reduction in costs of solar equipment and the existence of the Utah  
489 Solar Incentive Program, the Company expects this trend of increased net  
490 metering activity to continue.

491 **Q. Why is the Company proposing to apply the Net Metering Facilities Charge**  
492 **to residential customers only?**

493 A. The Company is proposing to apply the Net Metering Facilities Charge to net  
494 metering customers taking service under residential Schedules 1, 2 and 3 because  
495 the energy rates for these schedules recover a significant portion of fixed costs. As  
496 a result, when net metering customers are credited with the full retail energy rate,

497 their contribution to fixed costs are reduced and therefore shifted to other  
498 customers. In contrast, for non-residential rate schedules, the demand charges  
499 provide a significant portion of distribution and retail fixed cost recovery;  
500 therefore, at this time the Company is not proposing a net metering facilities  
501 charge for non-residential net metering customers until additional analysis can be  
502 completed to evaluate cost shifting impacts by these customers.

503 **Q. Please explain how net metering customers shift costs to other customers.**

504 A. Net metering customers continue to have energy requirements during times when  
505 their facility is not generating electricity or when their facility is not generating  
506 enough electricity to offset their usage. The net billing process, however, credits  
507 every kWh generated by the customer facility in excess of usage (i.e., the kWh  
508 fed back onto the grid) against usage at other times during the billing period, or  
509 even future billing periods. As a result of the kWh credits, the customer may not  
510 pay for all usage they have taken from the Company. Since the full retail rate that  
511 the customer is able to offset recovers both variable energy costs along with a  
512 significant portion of fixed costs, the net metering customer is not contributing to  
513 fixed cost recovery through the usage that the customer's excess generation is  
514 credited against. Since these fixed costs are not recovered from net metering  
515 customers, they increase the burden on other customers.

516 **Q. Some might argue that the reduction in billed kWh for net metering**  
517 **customers is similar to reduced usage from energy efficiency. Do you agree?**

518 A. No. Unlike a traditional energy efficiency measure where the load and impact on  
519 the grid will predictably be reduced by the implementation of the efficiency

520 measure, customers that install distributed generation have the same, or in many  
521 cases an increased impact, on the local distribution facilities. Frequently the  
522 Company is required to modify the distribution network in order to effectively  
523 minimize negative impacts on the grid and accommodate the new flow of  
524 electrons from the customer to the grid. Even in cases where upgrades are not  
525 required, the flow of energy back through transformers and onto the grid causes  
526 increased wear on the equipment.

527 **Q. What cost components are the Company proposing to include in the Net**  
528 **Metering Facilities Charge at this time?**

529 A. The Company is proposing to reflect only the distribution and retail service costs  
530 in the Net Metering Facilities Charge at this time. We believe that this is a good  
531 first step in addressing this issue. While additional fixed costs related to  
532 generation and transmission are also being incurred by net metering customers  
533 and shifted to other customers, we are not proposing a charge that recovers those  
534 costs or raising other potential net metering policy implications at this time.

535 **Q. Please explain how the Company calculated the proposed Net Metering**  
536 **Facilities Charge.**

537 A. The calculation of Net Metering Facilities Charge is shown in Exhibit  
538 RMP\_\_\_\_(JRS-8). The calculation of the residential charge starts with the same  
539 average of \$25.00 per customer per month from the COS study for distribution  
540 and retail costs. This amount is reduced by the proposed customer charge and  
541 fixed costs to be recovered through the forecast energy sales to net metering  
542 customers in the test period. This results in a \$4.25 per customer per month

543 proposed Net Metering Facilities Charge. Since this calculation takes into account  
544 the Company's proposed increase in the residential customer charge, if the  
545 customer charge is less than the proposed \$8.00 per month, then the proposed Net  
546 Metering Facilities Charge will increase in order to recover the fixed costs not in  
547 the customer charge.

548 **Q. Why is the Company proposing to implement the Net Metering Facilities**  
549 **Charge now?**

550 A. With the rapid growth in net metering and customer interest in distributed  
551 generation, the Company believes it is important to put in place now an  
552 appropriate rate structure that better reflects the value of net metering and  
553 minimizes cost shifting.

554 **Q. Please summarize your testimony.**

555 A. Consistent with Commission direction, the Company's proposed cost of service  
556 study treats and allocates costs among customer classes on a consistent basis with  
557 the way the Company's shared system costs are allocated to each state in the  
558 jurisdictional allocation model. The Company's proposed allocation of the  
559 revenue requirement increase is guided by the COS study results and moves all  
560 classes towards cost of service. For residential rate design, the Company proposes  
561 an \$8.00 monthly customer charge, an increase to all energy rates, and a \$15.00  
562 minimum bill. This proposed residential rate design balances cost causation,  
563 equity, revenue adequacy and customer impacts. The Company is also proposing  
564 an increase in the Low Income Lifeline Credit. For non-residential rates, the  
565 Company is generally proposing equal percentage increases to all rate

566 components. Lastly, in order to address cost shifting the Company is proposing to  
567 implement a Net Metering Facilities Charge of \$4.25 for residential customers on  
568 Schedule 135. The Net Metering Facilities Charge will recover the fixed costs for  
569 distribution and retail service.

570 **Q. Does this conclude your direct testimony?**

571 **A.** Yes, it does.
