I'd like to speak out that very little if anything made sense in the opinion piece by Rosetti & Florence. Such an over simplification will most likely gather a number of followers who will chime in and say, "yes I agree I want clean air". Who doesn't want clean air?

A good example is, "over 2000 using their own money, have installed residential solar...". What they don't mention is typically there are costs necessary to deal with the addition of the power to the grid and fixed costs we must all pay to maintain & upgrade the infrastructure. There have also been size able rebates given out to compensate these customers for their installation .

What I don't understand is why they don't push to close the IPP plant. Since most of its power goes to Los Angeles which receives all sorts of press for it's green low carbon programs. I realize there are plans to convert to natural gas, but that's not zero emissions. That would be a large reduction in emissions and force California to tell the truth to the uninformed public. Oh that's right, it would eliminate 100's of good paying jobs.

I'm sure RMP is trying to integrate renewables in a smart & responsible way. Please rely on all the facts not emotions stirred up by a few.
