In regards to Rocky Mountain Power's proposal to increase rates for those customers who have chosen to install a solar energy system to power their homes, at their own expense as a very conscious choice to improve OUR environment, please know that I am strongly opposed to this rate increase.

Clean air and healthy energy alternatives are very important to my husband and me. We are planning to build a solar powered home at retirement and are appalled to read that instead of receiving credit for our efforts, or at the very least paying the same rates as traditional power users, we will be penalized. Further, according to the Salt Lake Tribune, there are currently only about 2,000 users of solar power in Utah. Would the additional revenue from this small band of alternative energy users really make any difference in your operating budget? It seems like more of a deterrent and intimidation tactic to me.

Your organization should be incentivizing and doing all that it possibly can to move toward clean, healthy alternative energy options which benefit ALL of us.

Do not increase the rates on alternative energy users, it makes no sense.

Most sincerely,
Jacqueline Breslawski
