Dear Public Service Commission:

Regarding your costs-benefits study of the net metering, I encourage you to consider costs and benefits other than load on the grid.

As you know renewable energy has unique advantages that go beyond electrical load on the grid, including but not limited to reduced carbon emissions and the health benefits of not burning coal.

I urge you to consider all the issues related to renewable energy generation so that we encourage the transition to clean energy. It's time for Rocky Mountain Power to begin to account for the many hidden costs of their coal-based electric generation system that they impose on the public.

Thanks,
John Anderson
Sandy, Utah
