15. MISCELLANEOUS SWITCHED DIGITAL SERVICE OFFERINGS

15.4 INTEGRATED T-1 SERVICE

B. Definitions (Cont'd)

Basic ISDN 2B+D Single Line Service

Basic ISDN 2B+D Single Line Service consists of two B (Bearer) channels and a D (Delta) channel. Basic ISDN 2B+D Single Line Service requires three sequential distinct channels on an IT1.

• B (Bearer) Channel

The B-channel transports circuit-switched voice and/or data communications at speeds up to 64 kbps, from the customer's premises to the central office via an IT1 facility.

• D (Delta) Channel

The D-channel carries signaling and/or packet data information at speeds up to 16 kbps on Basic ISDN 2B+D from the customer's premises to the central office. The D-channel has both data and signaling functionality; it does not have voice capability.

Basic Dedicated Digital Data Channel[1]

(C)

Basic Dedicated Digital Data Channels are provided on an IT1 for 56 kbps or 64 kbps transmission of synchronous serial data. The actual bit rate is a function of the channel interface selected by the customer where applicable. The circuit provides a synchronous service, with timing provided by the Company through the Company's facilities, to the customer in the received bit stream. The Basic Dedicated Digital Data Channel as part of a DDS circuit is provided between customer-designated premises, between a customer-designated premises and a Company hub or designated digital wire center, or between Company hubs or designated digital wire centers.

Frame Relay Dedicated Digital Data Channel[1]

(C)

Frame Relay Dedicated Digital Data Channel provides access to Frame Relay Service (FRS). Frame Relay Dedicated Digital Data channels are configured at 56 or 64 kbps speed. One or more Frame Relay Dedicated Digital Data channels can be aggregated to provide such access. Utilizing statistical multiplexing, FRS enables users to allocate circuit bandwidth to applications as needed, up to the maximum bandwidth purchased, rather than assigning fixed channels to specific applications.
