To whom it may concern:

I benefitted from the RMP incentive and tax credits when I had my PV system installed in late 2007. The resulting savings in my power bill have been significant, and I anticipate actually recouping my investment eventually.

I believe the RMP incentive program benefits all Utahans, whether directly (as in my case) or indirectly, through the lessening of the need to build another coal-fired power plant which pollutes the air and continues our need for fossil fuels.

The incentive program should not only be continued, but should be expanded. I have some friends who tried to get an incentive for 2011, but found out that all of them were snatched up shortly after their availability. The demand is out here, and Rocky Mountain Power would be well served to meet it. Not only will it help to create a distributed network of clean power, but RMP's image will be greener - not a bad color to strive for. I can't imagine there is any downside to the continuation of this program, and encourage you to expand it and challenge other utilities to follow suit.

This program allows Joe Citizen to personally take steps toward a future of clean, sustainable alternative energy systems. We the public want to be part of the solution, and this is a great way to provide us that opportunity.

Thank you for considering my comments.

Regards,

Nancy Orr
