

1 **Q. Are you the same C. Craig Paice that presented direct testimony in this case?**

2 A. Yes I am.

3 **Purpose of Rebuttal Testimony**

4 **Q. What is the purpose of your rebuttal testimony?**

5 A. My rebuttal testimony presents PacifiCorp's revised 2010 Class Cost of Service
6 Study based on the twelve month future test period ending June 30, 2010. The
7 study has been updated to include changes in the Utah Results of Operations. In
8 addition, in response to issues related to the matching of customer and
9 jurisdictional loads, the methodology used to develop customer class loads has
10 been revised and the results of it are utilized in my updated cost of service study.
11 Additionally, some minor functional factor changes were made to address issues
12 identified during the discovery process. I also respond to the testimony of OCS
13 witness Mr. Paul Chernick, UIEC witness Mr. Maurice Brubaker, UAE witness
14 Mr. Kevin Higgins, and DPU witness Mr. Joseph Mancinelli.

15 **Summary of Results**

16 **Q. Please identify Exhibit RMP___(CCP-1R) and explain what it shows.**

17 A. Exhibit RMP___(CCP-1R) is the summary table from PacifiCorp's June 30, 2010
18 Class Cost of Service Study for the State of Utah. It is based on PacifiCorp's
19 revised annual results of operations for the State of Utah presented in the rebuttal
20 testimony of Company witness Mr. Steven R. McDougal. Page 1 of Exhibit
21 RMP___(CCP-1R) presents results at the Company's June 2010 rate of return
22 assuming current rate levels. Page 2 shows the results for the revised \$54.9
23 million price increase proposal. It also reflects the revised customer class loads as

24 presented in the rebuttal testimony of Company witness Mr. Scott D. Thornton.

25 **Q. Please identify Exhibit RMP___(CCP-2R) and explain what it shows.**

26 A. Exhibit RMP___(CCP-2R) shows the cost of service results in more detail by
27 class and by function. Page 1 summarizes the total cost of service summary by
28 class and pages 2 through 6 contain a summary by class for each major function.

29 **Cost of Service Study Changes**

30 **Q. Please explain why the Company revised the methodology used to develop**
31 **forecasted customer class loads.**

32 A. As described in Mr. Thornton's direct testimony customer class loads used in the
33 cost of service study that accompanied my direct testimony (see Exhibit
34 RMP___(CCP-3, Tab 5, Page 8) were based on historical hourly load research
35 data which was then aligned such that Mondays in the historical year match
36 Mondays in the forecast year, Tuesdays match Tuesdays, and so on and then
37 extrapolated to the forecasted class energy usage for the test period. As we
38 responded to data requests concerning customer class loads in this proceeding and
39 reviewed this issue more fully, we determined that this approach did not properly
40 characterize the class peak relationships among the classes. Rather than selecting
41 the load research results for the forecast peak dates as the prior approach did, we
42 believe it is more appropriate to utilize load research results for the actual peak
43 day for each month in the historical period and apply those results to the forecast
44 energy amounts in the test period to project the class monthly peak. In this way,
45 the relationships among the classes on the peak day are retained in the forecast
46 test period. This revised approach accurately represents Utah customers'

47 contribution to the PacifiCorp system peak and it significantly reduced the
48 disparity between forecast customer class load data and jurisdictional loads.
49 Using this revised methodology, the difference between forecast customer class
50 loads and jurisdictional loads is approximately two percent which is a significant
51 reduction from the nine percent difference Mr. Brubaker calculates in his exhibit
52 UIEC__(MEB-1), page 2. The Company's manager of Metered Data
53 Management, Mr. Thornton, discusses in greater detail the derivation of forecast
54 customer class load data and the reasons for differences between jurisdictional
55 and class loads in his rebuttal testimony.

56 **Q. Please explain the reasons for changing various FERC account functional**
57 **factors.**

58 A. During the discovery process the Company reviewed a significant number of
59 functional factors used in the cost of service study. It was determined that some
60 minor changes were warranted. These changes have been made in the revised
61 cost of service study. An itemized list of impacted accounts is provided in Exhibit
62 RMP__(CCP-4R). The overall cost implications produced insignificant changes
63 to customer class revenue requirements.

64 **Rebuttal of Mr. Chernick**

65 **Shared Services**

66 **Q. Why does the Company allocate service drops using a single service per**
67 **customer?**

68 A. The Company allocates service drop costs using a single service per average
69 customer because Company records do not contain data regarding the number of

70 customers per service drop. This fact has been stated in responses to OCS Data
71 Requests 7.3, 17.6, 17.7, 17.9, 17.10, and 17.11 in the current docket as well as
72 CCS Data Requests 35.4 in Docket No. 08-035-38 and CCS Data Request 10.12
73 in Docket No. 07-035-93.

74 **Q. Mr. Chernick states that his proposed method of allocating service drop costs**
75 **is an improvement over the Company's method. Do you agree?**

76 A. No. His analysis is limited to only the residential class. The service drop
77 allocation factor (F70) also allocates services costs to small general service, large
78 general service, traffic signal, and outdoor lighting customers. Since some of
79 these customers also share service drops, Mr. Chernick's method produces biased
80 results by reducing the allocation of services to residential customers while
81 offering no modification to the allocation of services for non-residential
82 customers.

83 **Q. Do you have other concerns with Mr. Chernick's proposed methodology**
84 **revision?**

85 A. Yes. Mr. Chernick's analysis of residential customers is based on the Utah 2000
86 Census of Housing data. Clearly, data from nearly ten years ago does not reflect
87 the present-day Utah residential housing composition nor does simply multiplying
88 this out-dated data by a count of the Company's total residential customers
89 accurately identify the Company's current residential customer base. Also, Mr.
90 Chernick assumes that there is a single standard "residential-sized" service drop
91 for each multi-family dwelling and that for each of the Census' multi-family
92 dwelling categories the average number of units for that category's range is

93 appropriate. For example, he assumes for the “3 or 4 units” category that each
94 multi-family dwelling complex in this category contains 3.5 residential customers
95 (units) and is served by one standard “residential-sized” service drop. Likewise,
96 for the “20 to 49 units” category he assumes that each multi-family dwelling
97 complex contains 34.5 residential customers (units) and is served by a single
98 standard “residential-sized” service drop. For the “50 or more” category, he
99 assumes one service for every 50 customers. Ultimately, Mr. Chernick’s proposal
100 effectively reduces the residential class’ allocation of services by 21 percent.

101 **Q. Do all of the residents within a multi-family dwelling complex necessarily**
102 **share the same service drop?**

103 **A.** No. It is possible for a large multi-family dwelling complex to be served by
104 several service drops. The configuration of service connections to multi-family
105 dwellings varies widely depending on the facility’s requirements and service
106 characteristics.

107 **Q. Would you expect the cost of a service drop used to serve a single residence**
108 **to be the same as a service drop used to serve multi-family residences?**

109 **A.** No. If multiple customers use a shared service drop, it is expected that a larger
110 conductor size would be required. Given the unique need of each facility, the
111 average cost for service drops shared by residential customers could vary widely
112 and be difficult to estimate.

113 **Q. Mr. Chernick states on lines 293 through 296 of his direct testimony that**
114 **“(t)he Company did not attempt to determine the portion of its residential**
115 **customers that are in multi-family buildings, the number of residential**
116 **service drops installed and in use, or a process for identifying shared**
117 **services.” Please comment.**

118 A. As stated in the Company’s response to OCS Data Request 17.9, “a number of
119 company personnel in Customer Service, Mapping Services, Corporate
120 Accounting and Utah Distribution Field Operations were contacted regarding the
121 issue of shared services. Confirmation was received that Company records do not
122 contain shared services data.” Shared services data is not collected by the
123 Company in Utah nor in any other state the Company serves because there has
124 been no need articulated nor prior requests for this information. If the
125 Commission determined that this information was needed, the Company and the
126 Commission would need to implement a public process to request a share services
127 study. Because such a study has never been performed, the Company is unable to
128 estimate its cost. Once a contractor was selected through the process, the cost of
129 the study would require prior approval from the Commission. Most likely, the
130 study would entail a thorough study design and a physical survey of all Utah
131 residential and general service customers (approximately 800,000 customers) in
132 order to determine and classify the types of shared services in place.

133 **Q. Please summarize problems with Mr. Chernick’s proposed reduction to the**
134 **allocation of services to the residential class.**

135 A. Mr. Chernick makes the following assumptions related to shared services:

- 136 • All non-residential customers are excluded.
- 137 • 2000 Census of Housing data accurately represents the current-day
- 138 residential housing composition.
- 139 • 2000 Census of Housing data reflects the Company’s residential
- 140 customer base.
- 141 • Every multi-family dwelling complex has only one service drop.
- 142 • The cost of a service drop serving only a single customer is the same
- 143 as that of one serving as many as 50 customers.
- 144 • There is a specific average number of customers per multi-family
- 145 dwelling complex (based on the average of a given range of units
- 146 within each housing category).

147 I disagree with each of his assumptions as described above.

148 **Q. Should Mr. Chernick’s method for allocating services be adopted?**

149 A. No. Mr. Chernick’s methodology for allocating shared services is not an

150 improvement as he suggests, it is only different. It is a seriously flawed analysis

151 that includes one-sided assumptions, inconsistency with distribution design

152 practices, and use of non-specific RMP customer information. For these reasons

153 it should be rejected.

154 **Classification of Generation and Transmission Costs**

155 **Q. Do you agree with Mr. Chernick that the cost of service study filed in this**

156 **docket understates the energy-related cost of generation?**

157 A. No, I do not. The cost of service study uses the Utah Public Service Commission

158 (the Commission) approved 75 percent demand and 25 percent energy

159 classification methodology for generation and transmission costs. The basis for
160 classifying generation plant 75 percent demand and 25 percent energy is to
161 recognize their design capability of meeting both peak demand and to generate
162 lower cost energy all hours of the day and during all seasons of the year.

163 **Q. Please explain why the current methodology employed in the Company's cost**
164 **of service study is appropriate for the state of Utah?**

165 **A.** This classification issue was one of the first raised at the time of the Utah Power -
166 Pacific Power merger since both companies previously utilized different
167 generation fixed-cost classification methodologies. Because the newly merged
168 company created a combined system comprised of seven states it was necessary to
169 find a methodology suitable to all parties. Studies were conducted by the Division
170 of Public Utilities (DPU) to determine the cause of production capacity costs with
171 their conclusions being adopted by the Commission staffs of the states served by
172 the Company to allocate jurisdictional costs. This methodology was also used in
173 Docket 90-035-06, the first post-merger case to allocate cost of service. Several
174 years following this docket, DPU studies were updated and the same conclusions
175 were reached. Since it was first introduced, the mix of 75 percent demand and 25
176 percent energy has been considered by the Commission to be reasonable. The
177 Commission's position, as stated in Section IV. A.2. of the order issued in Docket
178 97-035-01, provides the basis for use of this allocation methodology:

179 "We conclude that twelve monthly coincident peaks, with a 75
180 percent demand-related and 25 percent energy-related mix, is the
181 appropriate basis for allocating production and transmission costs
182 to classes in the Utah jurisdiction."

183 Classification of generation and transmission costs was addressed at length during
184 the Multi-State Process (MSP) discussions. As with earlier PacifiCorp
185 Interjurisdictional Taskforce on Allocations (PITA) analyses, there was no clearly
186 superior demand/energy classification split that emerged from analyses conducted
187 during the Multi-State Process (MSP). Because the 75 percent demand and 25
188 percent energy classification of generation fixed costs currently used by
189 PacifiCorp falls in the middle of the range of reasonable approaches, the
190 Company found no compelling reason to change the approach.

191 **Q. Have changes to the 75 percent demand and 25 percent energy allocation**
192 **method been proposed in previous rate cases?**

193 A. Yes. In Docket 01-035-01, USEA (United States Executive Agencies) witness
194 Mr. Joseph Herz argued in support of 100 percent demand classification of
195 generation fixed costs. He concluded that the 75 percent demand and 25 percent
196 energy classification was inappropriate “in that a portion of its demand related
197 costs are allocated according to energy use.” The Company provided testimony in
198 support of the 75 percent demand and 25 percent energy classification in this
199 same docket. RMP witness Mr. David L. Taylor stated:

200 “PacifiCorp classifies production and transmission plant and
201 non-fuel related expenses as 75 percent demand and 25 percent
202 energy related. The Company’s goal is to supply the lowest
203 total cost generation resources to meet our customers’ needs.”
204 (Docket 01-035-01, Taylor rebuttal, page 8).

205 In addition Dr. George Compton, of the DPU, also responded to Mr. Herz’
206 recommendations and conducted additional analysis on the classification
207 question.

208 **Q. What were the results of Dr. Compton's analysis?**

209 A. The analysis performed by Dr. Compton determined that a portion of the fixed
210 costs associated with generation plants are energy-related and that it is entirely
211 appropriate to allocate some of these costs in proportion to energy consumption.
212 Regarding the quantity of energy-related fixed costs, Dr. Compton's rebuttal
213 testimony in the aforementioned docket illustrates continued support for the
214 approved methodology where he stated that "... the 25% figure is reasonable."
215 (Docket 01-035-01, Compton Rebuttal, page 3)

216 **Q. Is the peaker allocation approach presented by Mr. Chernick an appropriate**
217 **method of determining energy-related generation plant costs?**

218 A. No. Although classifying some portion of generation fixed costs as energy-
219 related is appropriate, as previously explained, Mr. Chernick's approach reflects a
220 bias toward classifying an excessive portion of generation costs as energy-related.
221 The 1992 *Electric Utility Cost Allocation Manual* published by the National
222 Association of Regulatory Utility Commissioners (NARUC) states that using the
223 peaker method generally results in significant portions (between 40 to 75 percent)
224 of generation costs being classified as energy-related. In addition, Mr. Chernick's
225 approach applies simple calculations to a very complex issue. The complexities
226 involved in determining a proper allocation cannot be underestimated. Perhaps
227 this is best summarized by Dr. Compton, again in rebuttal testimony in Docket
228 01-035-01, where he referenced the difficulty involved in calculating an
229 appropriate demand and energy classification mix. His opinion provides guidance
230 on this subject:

231 “To perform a definitive analysis employing all (or even a large
232 portion of) the elements of the PacifiCorp demand/profile and
233 resources would be horrendously complex.” (Docket 01-035-01,
234 Compton Rebuttal, page 3)

235 Mr. Chernick’s approach lacks the complexity required to meet the qualifications
236 of a definitive analysis.

237 **Q. How should we view Mr. Chernick’s recommended changes in the energy**
238 **allocation of generation-related costs?**

239 A. These recommended changes should be rejected for the following reasons:

- 240 • This subject has received significant attention throughout the years following
241 the Utah Power - Pacific Power merger. The PacifiCorp Interjurisdictional
242 Task Force on Allocations (PITA), the Multi-State Process (MSP) and the
243 2005 Cost of Service and Rate Design Taskforce have all discussed this
244 subject at length with no resulting changes.
- 245 • The Utah PSC gave approval for use of this allocation method in cost of
246 service studies.
- 247 • Various analyses have been performed validating reasonableness of the 75
248 percent demand and 25 percent energy allocation.
- 249 • Approaches based on simplified mathematical computations lack objectivity
250 and ignore the importance associated with determining an appropriate
251 generation cost allocation method. Selection of an appropriate allocation
252 method requires extensive analysis.
- 253 • Mr. Chernick’s approach significantly increases the energy allocation of
254 generation costs (60 to 80 percent energy) which would create significant cost
255 shifts between the various rate schedules. Since the revenue requirement

256 spread to schedules is generally dependent upon cost-of-service information, a
257 large or abrupt change in cost allocations could ultimately produce large rate
258 variations violating the principle of gradualism. The principle of gradualism
259 has been held by the Utah PSC to be an important rate making principle in
260 order to avoid significant changes in customer rates.

261 **Allocation of Firm Non-Seasonal Purchases**

262 **Q. What is the basis for allocating purchased power expenses as presented in**
263 **the cost of service study?**

264 A. The basis is the *Allocations Task Force Report to the Utah Public Service*
265 *Commission* (December 16, 1999, page 21) which states:

266 “The PSC indicated in their Order in the last PacifiCorp rate case
267 their desire for consistent application of cost-causal principles in
268 both jurisdictional and class allocation studies. Consistency implies
269 that the same methodology would be used in both the jurisdictional
270 allocation and class cost of service models to allocate similar types
271 of costs.”

272 The Purchased Power expense allocation presented in the cost-of-service study is
273 consistent with allocations presented in the Jurisdictional Allocation Model
274 (JAM) and comports with the Commission’s perspective.

275 **Q. Do you agree with Mr. Chernick that the cost of service study understates the**
276 **energy-related portion of firm non-seasonal purchases?**

277 A. No. I disagree with his position for several reasons. First, Mr. Chernick’s
278 proposal would cause Sales for Resale revenue and Purchased Power Expenses to
279 be allocated differently. This is due to the fact that Sales for Resale revenue
280 would be allocated inconsistent with the cost of the resources supporting those
281 revenues. This same allocation issue, raised in Docket 97-035-01, was addressed

282 by the Company and the Division. The Allocation Taskforce arising from that
283 case also addressed this issue. A discussion on this subject was included in the
284 *Allocations Task Force Report to the Utah Public Service Commission* (December
285 16, 1999, page 13). The report stated:

286 “Early in the task force discussions, the parties agreed
287 with the principle that the sales for resale revenue should
288 be allocated on the same basis as the cost of making the
289 sales.”

290 The cost of service study maintains this proportional perspective when comparing
291 the percent of total sales for resale revenues to total purchases power expenses for
292 all classes.

293 Next, Mr. Chernick states that non-seasonal generation plant is more energy-
294 related than is shown in the cost of service. His only support for this assertion is
295 his discussion regarding use of a peaker method to allocate generation costs. As
296 previously discussed, this is not a definitive analysis.

297 Finally, he asserts that the Company does not attempt to separate the variable and
298 fixed components of firm non-seasonal purchases and treats all purchase costs as
299 fixed plant costs. He further estimates the energy-related percentage of firm
300 purchase costs as approximately 83 percent of short-term firm and long-term
301 contract costs projected in GRID runs prepared for this proceeding. Company
302 personnel who operate the GRID model have determined that there is no accurate
303 way to separate firm non-seasonal purchases between variable and fixed
304 components. Given that the Company cannot determine a capacity/energy
305 separation and that the approved Revised Protocol Methodology allocates these
306 costs in the Jurisdictional Allocation Model (JAM) using an SG factor (75 percent

307 demand, 25 percent energy), Mr. Chernick's estimate of firm non-seasonal
308 purchases being 83 percent energy-related is highly subjective, non-definitive,
309 and has the potential to shift costs among customer classes.

310 **Q. Please summarize your findings regarding current cost of service study**
311 **classification and allocation methodologies.**

312 A. The cost of service study filed by the Company is a reasonable representation of
313 cost functionalization, classification, and allocation of the Utah revenue
314 requirement. The 75 percent demand / 25 percent energy allocation accepted by
315 the Utah PSC and used in this study is an appropriate methodology which has
316 been significantly discussed and analyzed. Mr. Chernick's recommended
317 allocation changes to the cost study would produce cost shifts among customer
318 classes potentially creating large rate change variations across classes. He
319 provides no analyses to illustrate total potential class revenue requirement shifts.
320 Given the absence of cost movement indication it is impossible to ascertain the
321 full impact of Mr. Chernick's recommendations and determine if the principle of
322 gradualism would be preserved.

323 **Q. Does Mr. Chernick propose any additional modifications to the Company**
324 **cost of service methodology?**

325 A. Yes. Mr. Chernick believes that some part of distribution plant should be
326 classified as energy-related because duration of peak is a consideration when
327 designing the size of transformers and conductor. Mr. Chernick also believes that
328 substation weights should consider the size of substation peaks. These issues are
329 addressed in the rebuttal testimony of Rocky Mountain Power witness Mr. Lowell

330 E. Alt.

331 **Rebuttal of Mr. Brubaker**

332 **Allocation of Generation and Transmission Plant**

333 **Q. Mr. Brubaker argues for a change in the classification of generation costs.**
334 **Do you agree with his recommendation that generation and transmission**
335 **fixed costs should be classified as 100 percent demand related?**

336 A. No. PacifiCorp's generation portfolio includes different types of resources
337 including coal fired steam plants, hydro facilities, simple and combined cycle gas
338 combustion turbines, wind turbines, and purchases. Although it may be
339 reasonable to classify the fixed costs of simple cycle combustion turbines and
340 other peaking resources 100 percent demand related (which are designed to run
341 during peak load hours only) such a classification would not be appropriate for
342 the majority of PacifiCorp's portfolio. The Company's resource fleet is heavily
343 skewed toward base load plants that were constructed not only to meet peak load,
344 but also to produce low cost kilowatt-hours 24 hours per day, 7 days per week as
345 needed to provide the energy requirements of all customers. The capital
346 investment of a coal fired steam plant and other base load plants is greater than
347 the capital investment of a peaking turbine. This additional investment was made,
348 not to meet the peaking needs of the Company, but to generate lower cost kilowatt
349 hours. Therefore, it would seem reasonable that some of the additional capital
350 investment be classified as energy related. Although Mr. Brubaker's
351 recommendation contrasts significantly with OCS consultant Mr. Chernick's
352 position (significant increase in energy classification), the Utah Public Service

353 Commission approved 75 percent demand and 25 percent energy classification
354 methodology employed in the cost of service study represents a “middle-of-the-
355 road” approach as determined from analyses conducted during the MSP which I
356 referenced earlier in my testimony.

357 **Q. Do you agree with Mr. Brubaker’s opinion that because of growth in**
358 **summer peak compared to loads in other seasons that allocation of**
359 **generation and transmission plant using 12 coincident peaks (CP) is out-**
360 **dated?**

361 A. I agree that summer peak loads are growing. For this reason, the Company
362 introduced modifications to the allocation of generation fixed costs and net power
363 costs (first presented in Docket 06-035-21) to reflect the impact of seasonal costs
364 and load differences. These modifications represent a step toward meeting the
365 objective of recognizing seasonal load and cost differences in the cost of service
366 study without causing significant cost shifts between customer classes. However,
367 I do not agree that the 12 CP cost allocation methodology is out-dated for two
368 reasons. First, even though RMP is a summer-peaking utility costs are allocated
369 throughout the year based on the entire integrated system because that is how the
370 system is planned and dispatched. This is evident from the fact that Gadsby, one
371 of the Company’s peaker plants, was in operation during 10 consecutive months
372 from June 2008 through March 2009. A 12 CP allocation for system demand
373 costs has been used since the Utah Power - Pacific Power merger in 1989 and
374 continues to be used because it represents actual system operations. It recognizes
375 that each of the monthly peaks is important. Second, it is appropriate for

376 allocation methods to be consistent between inter-jurisdictional and class cost of
377 service allocations. These two positions comport with Utah PSC findings (see
378 order in Docket 97-035-01, Section IV.A.2, 4 respectively).

379 Q. **How do the alternative allocation methodologies recommended by Mr.**
380 **Brubaker impact cost of service results?**

381 A. Mr. Brubaker proposes to allocate generation among classes and supports using
382 either a 3CP or Average and Excess Demand (AED). He states that either method
383 shows Schedule 9 customers earning a rate of return substantially in excess of the
384 system average and deserving a rate reduction. This is the underlying benefit of
385 either methodology. However, Mr. Brubaker fails to mention how his
386 recommendations impact other customer classes. Page 2 of both exhibits,
387 UIEC__(MEB-8) and UIEC__(MEB-9), illustrate how dramatically costs shift
388 among other rate schedules at the target rate of return. For example, the 3CP
389 method shows the residential class needing approximately a \$36 million revenue
390 requirement increase, yet the AED method shows these same customers needing a
391 revenue requirement increase in excess of \$52 million. Schedule 6 customers
392 receive more than a \$30 million increase using the 3CP but only a \$9 million
393 (approximate) increase with the AED method.

394 Q. **What conclusions can be drawn from Mr. Brubaker's recommendations?**

395 A. Neither the 3CP or AED allocation methods are appropriate for the Utah
396 jurisdiction since they do not represent how the Company's system is planned and
397 dispatched. Additionally, the magnitude of cost shifting among customer classes
398 using either of Mr. Brubaker's recommended methods coupled with the

399 inconsistency of revenue requirement increases/decreases among customer classes
400 would clearly create an unstable rate environment and significantly violate the
401 principle of gradualism. As can be seen in this case, parties have varying
402 opinions on this subject, the UPSC approved 12CP, 75 percent demand / 25
403 percent energy allocation method is the appropriate methodology for cost
404 allocations in the state of Utah given that it represents a “middle-of-the-road”
405 methodology.

406 **Transmission Revenue Requirement**

407 **Q. In his testimony, Mr. Brubaker requests that the Company reconcile the**
408 **\$118 million transmission-related revenue requirement shown in the cost of**
409 **service Exhibit RMP___(CCP-1) with the \$55 million amount set forth in a**
410 **filing made by PacifiCorp with the Federal Energy Regulatory Commission**
411 **(“FERC”). How do you explain the differences between these amounts?**

412 A. Mr. Brubaker incorrectly characterizes the FERC filing as specifying the
413 Company’s total transmission-related revenue requirement for Utah retail service.
414 It does not. Although not specifically identified in his testimony, but as indicated
415 in UIEC response to RMP data request 1.1, Mr. Brubaker indicated that he was
416 referring to PacifiCorp’s August 31, 2009 filing of an annual update to its load
417 ratio share data, as required by PacifiCorp’s Open Access Transmission Tariff
418 (“OATT”) for FERC-jurisdictional transmission service. PacifiCorp is a
419 transmission provider that offers various types of transmission service under the
420 terms and conditions of its OATT, which also sets forth the pricing for these
421 services. PacifiCorp’s transmission customers taking network service pay for this

422 service based on their load ratio share. Load ratio share is the ratio of a network
423 customer's load to the transmission provider's total transmission system load,
424 computed in accordance with applicable provisions of the OATT. Network
425 customers are responsible for paying charges for network service equivalent to
426 each network customer's respective load ratio share percentage of the
427 transmission provider's annual transmission revenue requirement. Also pursuant
428 to the OATT, PacifiCorp must update its load ratio share calculation annually
429 with actual metered-value data from the prior year. The updated data from the
430 prior year is effective August 1 of each year and reflects the prices that network
431 customers must pay for network service for the coming year.

432 In its August 31, 2009 filing required by FERC to update its load ratio share data,
433 PacifiCorp included an Exhibit C showing a comparison of current and
434 anticipated revenues from network customers based on the updates to the data.
435 Exhibit C contains a table which lists all of PacifiCorp's network customers,
436 including PacifiCorp Energy. The table shows that PacifiCorp Energy's updated
437 load ratio share for the network service utilized for Utah network load is 22.76711
438 percent. This percentage is then applied to the transmission provider's annual
439 transmission network revenue requirement, resulting in annual network service
440 pricing of \$55,177,921.

441 This value does not represent, as Mr. Brubaker suggests, RMP's entire
442 transmission revenue requirement for Utah retail service. In order to reliably serve
443 load, PacifiCorp Energy must also purchase transmission service from other
444 transmission providers besides PacifiCorp. In addition, PacifiCorp Energy may

445 also purchase other types of transmission service from transmission providers in
446 order to serve load, including point-to-point transmission service. These types of
447 charges are not reflected in the \$55,177,921 amount shown in Exhibit C of the
448 FERC filing.

449 **Q. Mr. Brubaker states that he wouldn't expect these two values to be exactly**
450 **equal. How does the amount in the cost of service study compare with the**
451 **amount in the required FERC OATT load ratio share filing once**
452 **transmission service purchased from other providers is included?**

453 A. Very favorably. In the filed cost of service study in this case, FERC account 565,
454 Transmission of Electricity by Other, totals slightly more than \$58 million. If one
455 adds this amount to \$55.2 million contained in the 2008 test period FERC filing,
456 the total is over \$113 million. The total amount in the cost of service study for the
457 forecast test period ended June 2010 is approximately \$118 million--a difference
458 of only four percent.

459 **Rebuttal of Mr. Higgins**

460 **MSP Rate Mitigation Cap Allocation**

461 **Q. Do you agree with Mr. Higgins that the Company's treatment of the MSP**
462 **Rate Mitigation Cap in the class cost of service approach is incorrect?**

463 A. No. I do not believe the Company's treatment of the MSP Rate Mitigation Cap
464 (RMC) employed in the filed cost of service study produces a conceptual error.
465 Cost of service treatment of the RMC is consistent with the Company's
466 representations before the Commission in the hearing to approve the MSP
467 Stipulation held on July 19, 2004 as evidenced by the following:

468 CHAIRMAN CAMPBELL: What about the rate mitigation? How
469 does that work?
470 MR. TAYLOR: ...We will then take the proposed total state revenue
471 requirement under the rolled-in allocation method times 101.5 percent.
472 ...That will then become the maximum revenue requirement that the
473 Company would request from the state. And if that number is smaller
474 than... the revised protocol, that rolled-in plus one-and-a-half percent
475 become the target revenue requirement.
476 That number is then input into the class costs of service model as
477 the target revenue requirement, and then ... it would calculation-wise
478 make the return look a little lower, because the costs will all have
479 been allocated under the revised protocol, but then you have a target
480 revenue requirement that is somewhat lower. So the return component
481 in that calculation will show up as being a little bit smaller. (Transcript
482 Pages 53 – 55).

483 **Q. According to Mr. Higgins, why does he feel the Company’s approach is**
484 **incorrect?**

485 A. Mr. Higgins’ opinion is that the RMC reduces the allocation of generation costs to
486 the state of Utah instead of reducing the Company’s return on rate base. Because
487 of this viewpoint, he recommends that the impact of the RMC be reflected as a
488 reduction to generation expense so that the Company return is unaffected.

489 **Q. Do you agree with this portrayal of RMC?**

490 A. No. The RMC does not reduce Utah’s allocation of costs. The MSP Revised
491 Protocol as stipulated by the Utah parties, including those represented by Mr.
492 Higgins, and approved by the Utah Commission is the methodology used to
493 allocate costs to Utah. Therefore, Utah is allocated its full proportional share of
494 total Company costs. The RMC does not limit the allocation of generation costs it
495 only limits the level of revenues the Company is allowed to collect effectively
496 lowering the rate of return the Company will actually realize in Utah. The
497 Company’s cost of service study reflects the impact of the RMC by incorporating

498 this lower “effective” return on rate base it produces.

499 **Q. Are there other alternatives to the cost of service treatment of the RMC?**

500 A. Certainly. A Company suggested alternative to current cost of service treatment
501 would be to lower the target return for the generation function, producing a
502 different return for them when compared to the rates of return for other functions.
503 The Company is not in opposition to examining this or other alternative
504 approaches and welcomes input from all parties regarding additional methods for
505 treating the RMC. However, the Company’s traditional view is that all business
506 functions produce the same rate of return.

507 **Income Tax Expense Allocation**

508 **Q. Please explain Mr. Higgins’ recommendation for the allocation of income tax**
509 **expense to the classes.**

510 A. Mr. Higgins proposes allocating a calculated income tax expense to each class
511 based upon that class’ forecast present revenue. Under such an approach, each
512 class’ income tax expense responsibility would be related to the current level of
513 revenues which that class is paying. A class whose earnings exceeded an allowed
514 rate of return would be allocated more taxes than is their fair share and allocated
515 less if earnings fell short of an allowed rate of return.

516 **Q. What problems are associated with Mr. Higgins’ method?**

517 A. Mr. Higgins’ method for allocating income tax expense is based upon the actual
518 current level of revenue that is being collected from each customer class.
519 Depending upon the class selected, this amount may be below, at or above cost of
520 service. For example, the Street and Area Lighting class’ annual revenue is

521 \$13,383,047, but its cost of service at the earned level is at \$11,001,878. In other
522 words, the Street and Area Lighting class pays nearly an 18 percent premium to
523 its cost of service. Conversely, the Irrigation class' annual revenue is
524 \$10,962,790, while its cost of service at the earned level is \$12,745,293, a
525 discount of just over 16 percent. Implementing Mr. Higgins' method would
526 produce counter-intuitive results, as it rewards classes that pay less than their cost
527 of service and punishes classes that pay more.

528 **Q. Why does the Company allocate income tax expense to the classes within its**
529 **cost of service model using rate base?**

530 A. State and federal income tax expense (accounts 40911 and 40910) are allocated to
531 each cost of service class on functionalized Factor 101- Rate Base since the
532 Company earns a rate of return on its rate base and is taxed on its earnings.
533 Additionally, in Docket No. 79-035-12 the Commission ordered the Company to
534 allocate federal income tax expense on rate base and reaffirmed this decision in
535 Docket No. 97-035-01. The Commission order specifically stated at page 88:

536 "Any move to functionally unbundle cost-of-service analyses
537 makes allocating income taxes based on taxable income
538 even more problematic. Currently, separate rates for the
539 production, transmission, and distribution functions do not
540 exist, so revenues and taxable income by function are not
541 directly identifiable. But when rate base is allocated to
542 functions, income taxes by function can be determined. For
543 these reasons, we conclude that income taxes should be
544 allocated based on relative rate base."

545 As such, the method used by the Company in the cost of service study comports
546 with the UPSC's position.

547 **Rebuttal of Mr. Mancinelli**

548 **Cost of Service Model**

549 **Q. Mr. Mancinelli compares and contrasts Dr. Logan's cost of service model**
550 **(Logan Model) with the Company's. Please summarize this discussion.**

551 A. In his testimony, Mr. Mancinelli describes reviewing both the Company's cost of
552 service model and the Logan Model and expresses his preference for the Logan
553 model. He also characterizes the Company's cost of service model as being non-
554 transparent, difficult to use, and containing logic that is hard to follow.

555 **Q. Do you agree with Mr. Mancinelli's criticisms of the Company's cost of**
556 **service model?**

557 A. No. With some training, the Company's comprehensive cost of service model is
558 easy-to-use and very transparent. Becoming proficient with the model's
559 mechanics may require some assistance but with some effort, the ability to
560 skillfully operate the model is obtainable in a relatively short period of time. I
561 have observed and assisted numerous individuals, both inside and outside of the
562 Company, who achieved success with model operation.

563 **Q. Has the Company's embedded cost of service model previously been**
564 **criticized with respect to the level of difficulty involved in its use?**

565 A. No. Since the Company's unbundled cost of service model was first introduced in
566 the late 1990's, I do not recall any filed complaints about the level of difficulty
567 with the model's operation as Mr. Mancinelli has. This model, with various
568 improvements made over time, has been used in numerous regulatory proceedings
569 in different states where the Company files embedded cost of service studies.

570 **Q. Has the Company made efforts to familiarize and train interested parties**
571 **with the Company's cost of service model.**

572 A. Yes. The Stipulation in Cost of Service and Rate Spread – Phase II in Docket No.
573 08-035-38 called for a work group to address the mechanics of the COS model
574 and to hold at least three substantive work group meetings within 90 days of
575 stipulation approval. The first of these meetings was held on June 11, 2009 with
576 interested parties and additional meetings were held in July and August. The
577 Company addressed all issues raised by the parties and developed a
578 comprehensive Cost of Service Instruction Manual (49 pages) with copies
579 distributed to all participants. Realistic scenarios were also included to assist
580 users to make changes as desired. Also, a list of Company personnel available for
581 consultation regarding model operation was included with the manual. This
582 manual is provided as Exhibit RMP___(CCP-5R) to illustrate the level of detail
583 included in the instructions.

584 **Q. Were any Company personnel contacted regarding the cost of service model?**

585 A. Not to my knowledge.

586 **Q. Mr. Mancinelli expressed his preference for the Logan model and stated that**
587 **he primarily relied upon it for his analysis. Please comment.**

588 A. As Mr. Mancinelli stated, "RMP has concluded that the Logan Model is an
589 alternative model that renders the same results as the RMP cost of service model."
590 The Company takes no issue with other parties using the Logan model and
591 acknowledges that it is a fine analytical tool. However, as expressed by Dr.
592 Logan during work group meetings, his model does not meet the Company's

593 requirements which are different than his own. Specifically, the Company's
594 model is structured to easily print necessary regulatory exhibits and it has been
595 formatted so results from the JAM can be efficiently and accurately downloaded
596 with minimal effort.

597 It is natural that individuals have varying preferences. I personally have some
598 difficulty navigating the Dr. Logan's Model because I am not particularly familiar
599 with it, however, I do know that his model is well suited to his specific
600 preferences. Mr. Mancinelli's criticism of the Company's model, in my opinion,
601 is unwarranted.

602 **Functionalization and Allocation**

603 **Q. Do you agree with Mr. Mancinelli's claim that the Company's cost of service**
604 **model does not explicitly classify costs identified at the functional level and**
605 **they could be considered skipped?**

606 A. Absolutely not. The "Func Study" tab in the cost of service clearly illustrates, in
607 summary and itemized detail format, functionalized FERC account and
608 subaccount data that is downloaded directly from the JAM. At this point, the
609 JAM and cost of service data matches dollar-for-dollar. Since the JAM does not
610 classify costs, this tab also provides a classification of functionalized data.
611 Functionalized and classified data, through use of macros built into the cost of
612 service model, is then allocated to the various customer rate schedules according
613 to internal and external allocation factors which are detailed in the "COS Factor
614 Table" tab. All data is identified and labeled to assist with data flow recognition.
615 Again, this model has been used for many years by the Company and never has

616 data been considered “unidentified” or “skipped.”

617 **Q. Mr. Mancinelli proposes use of seasonal allocation factors to allocate a**
618 **number of items. Why does the Company allocate these items using Factor**
619 **10 instead of seasonal allocation factors?**

620 A. The cost of service study’s prior use of seasonal system allocation factors was
621 replaced with the Company’s proposed method for classifying and allocating all
622 generation and transmission fixed costs since all generation resources are now
623 allocated on a seasonal basis. This method is based on Proposal #9 from the
624 December 15, 2005 Utah Cost of Service and Rate Design Taskforce Report to
625 the UPSC and was initially employed in the cost of service study filed in Docket
626 06-035-21. The Task Force was able to achieve a general consensus that the
627 Company should explore a cost of service method that better reflects seasonal and
628 time differentiated load and cost differences without causing significant cost shifts
629 between customer classes. This objective is achieved through use of monthly
630 coincident peak weightings applied to the demand component of Factor 10.

631 **Q. Mr. Mancinelli proposes changing the functionalization and allocation**
632 **factors for a number of line items within the cost of service study, because he**
633 **feels that they better reflect the PITA factors used for those line items within**
634 **the JAM. Do you agree with his recommendations?**

635 A. I agree with several of his recommendations and disagree with others. The cost of
636 service study filed with my rebuttal testimony incorporates the revisions proposed
637 by Mr. Mancinelli with which the Company agrees. Exhibit RMP____(CCP-4R)
638 lists these revisions. These revisions have minimal cost allocation impacts on

639 customer classes.

640 **Q. Please explain why you disagree with other recommendations Mr.**
641 **Mancinelli's makes regarding cost classification.**

642 A. As stated in the response to DPU Data Request 44.2 costs are collected for
643 regulatory reporting purposes into the Business Warehouse (BW) database. Each
644 account balance is assigned a functional identifier since they are directly related to
645 one or more of the primary business functions: Production (P), Transmission (T),
646 Distribution (D) (or Distribution Poles and Wires (DPW)), Retail (R), or
647 Miscellaneous (M). The functional identifier is driven by the location code
648 associated with an asset or transaction. In some cases the business purpose of the
649 asset or transaction is used rather than the physical location.

650 Account balances from BW are aggregated into the Jurisdictional Allocation
651 Model (JAM) by FERC account and by a Revised Protocol jurisdictional
652 allocation factor which roll up to a line item. PITA factors were developed by the
653 2002 MSP working group for each FERC account in the JAM. Line items, which
654 are organized by FERC account and PITA factor, are then assigned or allocated to
655 one or more of the five functions using functional factors (FUNC factors) created
656 in the Functional Factor file provided as Exhibit RMP___(CCP-3), Tab 3. FUNC
657 factors are selected which most closely correspond to the FERC account and
658 PITA factor of the line item being examined. JAM data is then downloaded into
659 the Cost of Service (COS) study such that both models are populated with the
660 same underlying data. Line items are functionalized in the same manner in both
661 the JAM and COS study.

662 **Q. Please provide an example of how FUNC factors are determined.**

663 A. I will present an example for two different accounts: Account 154 and Account
664 397. Each of the items within Account 154 – Materials and Supplies is
665 functionalized on the MSS functional factor. The MSS functional factor is
666 developed from the end-of-year balances of Materials and Supplies that are
667 related to each function as reported within the Company’s FERC Form 1 on page
668 227. The calculation of this factor is shown in Exhibit RMP__(CCP-3), Tab 3,
669 Page 15.

670 Each of the items within Account 397 – Communication Equipment is
671 functionalized on the COM-EQ functional factor. The COM-EQ functional factor
672 is developed by applying functional percentage estimates for the balances of 20
673 subaccounts in the Account 397 total. The calculation of this factor is shown in
674 Exhibit RMP__(CCP-3), Tab 3, Page 6. Mr. Mancinelli’s assertion that the
675 Company ignores underlying cost classification as set forth in the JAM is
676 incorrect since FUNC factors provide greater detail and clarification regarding
677 various accounts than is show in the JAM.

678 **Q. Mr. Mancinelli proposes changing the functionalization factors for both**
679 **Account 154 and Account 397 to be more consistent with the PITA factors**
680 **employed in the JAM model. Shouldn’t Account 154 and Account 397 be**
681 **functionalized in a manner consistent with the PITA factors in the JAM as**
682 **Mr. Mancinelli proposes?**

683 A. No. The Company tries to maintain consistency between the JAM model and the
684 functionalization that takes place in the “Func Study” tab of the cost of service

685 model. For example, when the (CN) PITA factor is employed within the JAM
686 model for a particular line item, generally that same line item is functionalized on
687 the corresponding (CUST) FUNC factor within the “Func Study” tab of the cost
688 of service model. Other corresponding factors include the (SE) PITA factor and
689 (P) FUNC factor, the (SSGCH) PITA factor and the (P) FUNC factor, and to a
690 lesser extent the (SO) PITA factor and the (PTD) FUNC factor. While a specific
691 FUNC factor may often be used when a similar corresponding PITA factor is
692 used, this is not always the case. It is important to keep in mind that PITA factors
693 and FUNC factors are used for different purposes. If more detailed information is
694 available for functionalization purposes, an alternative FUNC factor may be used
695 such as is done with the MSS and COM-EQ FUNC factors for accounts 154 and
696 397. The PITA factors used for these accounts, however, are sufficient for the
697 purposes of apportioning costs among the states.

698 **Q. How should Mr. Mancinelli’s proposal that wind generation resources be**
699 **allocated entirely on energy be viewed?**

700 A. The cost of service attempts to maintain consistency with the JAM and allocations
701 performed within the JAM are subject to review of the MSP Standing Committee.
702 Mr. Mancinelli’s proposal would have to be presented to the Committee for review
703 and comment.

704 **Q. Mr. Mancinelli states that he agrees with Mr. Higgins that the RMC**
705 **adjustment should be applied solely to the Production function. Do you**
706 **agree with this assertion?**

707 A. As I stated earlier in my testimony in response to Mr. Higgins’ proposal regarding

708 this issue, the Company has suggested a possible alternative to current cost of
709 service treatment and is not in opposition to examining alternative approaches.
710 Since this issue was discussed during the 2005 Utah Cost of Service and Rate
711 Design Taskforce without reaching consensus, the Company suggests additional
712 discussion be conducted to determine the most appropriate approach. Given the
713 revenue requirement impacts to other customer classes, input should be received
714 from all impacted parties.

715 **Workpapers**

716 **Q. Have you included your workpapers?**

717 A. Yes. Exhibit RMP___(CCP-3R) is a CD that includes the cost of service study
718 underlying the summary tables in Exhibit RMP___(CCP-1R) and Exhibit
719 RMP___(CCP-2R).

720 **Q. Does this conclude your rebuttal testimony?**

721 A. Yes it does.
