

Sophie Hayes (12546)
Utah Clean Energy
1014 2nd Ave.
Salt Lake City, UT 84103
801-363-4046
Attorney for Utah Clean Energy

BEFORE THE PUBLIC SERVICE COMMISSION OF UTAH

In the Matter of the Application of
Rocky Mountain Power for Authority to
Increase its Retail Electric Service Rates in
Utah and for Approval of its Proposed Electric
Service Schedules and Electric Service
Regulations

Docket No. 10-035-124
UCE Exhibit 1.0D [COS+RD]

DIRECT TESTIMONY OF SARAH WRIGHT

ON BEHALF OF

UTAH CLEAN ENERGY

[COST OF SERVICE AND RATE DESIGN]

June 2, 2011

1

2 **INTRODUCTION**

3 **Q: Please state your name and business address.**

4 A: My name is Sarah Wright. My business address is 1014 2nd Ave, Salt Lake City, Utah
5 84103.

6 **Q: By whom are you employed and in what capacity?**

7 A: I am the Executive Director of Utah Clean Energy, a not-for profit public interest
8 organization that works to advance energy efficiency and renewable energy in Utah.

9 **Q: On whose behalf are you testifying?**

10 A: I am testifying on behalf of Utah Clean Energy (UCE).

11 **Q: What is Utah Clean Energy's interest in this docket?**

12 A: Utah Clean Energy works to advance both energy efficiency and renewable energy as
13 part of a cleaner, safer, more sustainable energy future. Utah Clean Energy is interested in
14 dramatically increasing the amount of energy efficiency implemented in Utah, as we consider
15 energy efficiency to be a high priority resource for Utah that saves money, preserves energy
16 resources, reduces greenhouse gas emissions, and helps improve environmental quality, public
17 health, and energy security.

18 **Q: What is the purpose of your testimony?**

19 A: The purpose of my testimony is to support designing rates to encourage energy
20 conservation. Numerous Utah policies emphasize and prioritize energy efficiency and
21 conservation as a priority resource. I will describe these policies in order to show that
22 encouraging conservation should be prioritized when designing electricity rates in this rate case.

23 Residential electricity rates can encourage energy efficiency and conservation if designed to send

24 appropriate price signals. I will outline some rate design principles and make residential rate
25 design recommendations based thereon.

26 **Q: Please provide your professional experience and qualifications.**

27 A: I am the founder and director of Utah Clean Energy, a non-profit public interest group
28 working to advance energy efficiency and renewable energy. Through my work with Utah Clean
29 Energy, I have been involved in a number of regulatory dockets in both the natural gas and
30 electricity arenas. These proceedings include Integrated Resource Planning, rate cases, tariffs,
31 and miscellaneous dockets relating to energy efficiency and renewable energy. I serve on the
32 both Rocky Mountain Power's and Questar Gas Company's Demand Side Management
33 Advisory Committees. I have over ten years of energy policy experience and I have served on
34 numerous energy policy working groups and taskforces including: the Energy Efficiency and
35 Energy Development Committees supporting Governor Herbert's Energy Task Force and Ten
36 Year Energy Plan, the Governor's Utah Renewable Energy Zone Task Force, Governor
37 Huntsman's Energy Advisory Council and Blue Ribbon Climate Change Advisory Council, and
38 Utah's Legislative Energy Policy Workgroup, providing information and policy support for
39 energy efficiency and renewable energy. I currently serve on Salt Lake City's Climate Action
40 Task Force, Utah Technology Council's policy committee, and engage in regional policy
41 activities including the Western Governors' Association and the Western Climate Initiative.

42 For the 15 years prior to founding Utah Clean Energy, I was an occupational health and
43 environmental consultant working on occupational health and ambient air quality issues for a
44 wide variety of commercial, industrial and governmental clients across the west.

45 I have a BS in Geology from Bradley University in Peoria, Illinois and a Master of
46 Science in Public Health from the University of Utah in Salt Lake City. My resume is attached
47 at the end of my testimony.

48 **Q: Have you testified previously before this Commission?**

49 A: Yes. I testified on behalf of Utah Clean Energy in Docket No. 05-057-T01, In the matter
50 of the joint application of Questar Gas Company, the Division of Public Utilities, and Utah Clean
51 Energy for approval of the Conservation Enabling Tariff adjustment option and accounting
52 orders.

53

54 **OVERVIEW AND CONCLUSIONS**

55 I conclude that there is ample policy support in Utah to prioritize energy conservation when
56 designing rates for the residential class. I recommend use of the Commission-approved
57 methodology for calculating the monthly customer charge. I further recommend that the third
58 block be set at no less than \$0.14/kWh. I conclude that designing residential rates in accordance
59 with the foregoing will result in rates that are just and reasonable, in the public interest, and that
60 send stronger price signals to encourage energy conservation and efficiency. I acknowledge that
61 the Company may have a throughput incentive that is counter to advancing energy efficiency and
62 request that the Public Service Commission establish a workgroup to analyze this issue.

63

64 **POLICIES SUPPORTIVE OF PROMOTING ENERGY EFFICIENCY**

65 **Q: Why is energy conservation important?**

66 Energy efficiency and energy conservation are the cheapest and cleanest energy resources we
67 have available to meet our growing energy demand, and there is tremendous untapped energy

68 efficiency potential. Two recent national studies by McKinsey Company and the National
69 Academy of Sciences show that we can meet 20 to 30 percent of the nation’s business as usual
70 energy demand projections by 2020 and 2030 respectively, if we deploy energy efficiency
71 practices and technologies more quickly than they have been previously deployed. The
72 McKinsey study also reports that the residential sector represents 35% of the total end use energy
73 efficiency potential¹. The National Academy of Science analysis finds that energy efficiency can
74 meet all of our new electricity demand, stating that, “In buildings alone, these technologies could
75 eliminate the need to increase electric generating capacity, despite economic and population
76 growth.”² Clearly energy efficiency and energy conservation are extremely valuable resources
77 that must be developed and encouraged.

78 **Q: How have Utah policy-makers acknowledged the importance of energy efficiency**
79 **and conservation?**

80 A: Most recently, Governor Herbert, in his energy plan for Utah, *Energy Initiatives and*
81 *Imperatives: Utah’s 10-Year Strategic Energy Plan*, identified the following goals with regard to
82 “[m]aximiz[ing] Utah’s commitment to energy efficiency”³: “Modernize the regulatory
83 environment to support sustainable power generation, energy transmission solutions and energy
84 conservation” and “Promote energy efficiency, conservation, and peak consumption
85 reductions.”⁴

¹ McKinsey Company, *Unlocking Energy Efficiency in the US Economy* (July 2009) at iv, available at http://www.mckinsey.com/en/Client_Service/Electric_Power_and_Natural_Gas/Latest_thinking/Unlocking_energy_efficiency_in_the_US_economy.aspx. (The McKinsey report looks through 2020 while the National Academies report looks through 2030.)

² The National Academies, *Real Prospect for Energy Efficiency in the United States: Report in Brief* (2009) at 1, available at http://dels-old.nas.edu/dels/rpt_briefs/aef_efficiency_brief_final.pdf.

³ Governor Gary R. Herbert, *Energy Initiatives and Imperatives: Utah’s 10-Year Strategic Energy Plan* (March 2, 2011) at 8, available at <http://www.utah.gov/governor/docs/10year-strategic-energy.pdf>.

⁴ *Id.* at 3.

86 Utah’s 10-Year Strategic Energy Plan further highlights the importance of the regulatory
87 process in encouraging energy conservation: “Utah’s regulatory framework is most effective in
88 focusing its efforts in reducing overall energy consumption, managing peak loads through best
89 practices, and supporting energy efficiency and demand response programs, consumer education,
90 and *utility rate design to promote energy efficiency and conservation.*”⁵

91 In addition to Utah’s Governor, the State Legislature has also provided policy direction to
92 electric utilities, regulators, and others to create incentives to increase energy efficiency and
93 conservation. In the Legislature’s 2009 H.J.R. 9—*Joint Resolution on Cost-effective Energy*
94 *Efficiency and Utility Demand-side Management*—Utah’s lawmakers expressed support for
95 innovative rate designs intended to increase efficiency and conservation, as long as they are in
96 the public interest.⁶

97 **Q: What other policies support energy conservation as a priority principle in designing**
98 **rates in Utah?**

99 A: Utah Code 54-3-1, which requires that all charges made, demanded, or received by a
100 public utility shall be just and reasonable, also explains that the scope of just and reasonable may
101 include means for encouraging energy conservation. Additionally, Utah Code 54-4-4.1 now
102 specifically provides that methods of just and reasonable rate regulation may include rate designs
103 that utilize volumetric, demand, fixed, and variable rate components.

104 **Q: How do these statutes support energy conservation as a priority principle in**
105 **designing rates?**

⁵ *Id.* at 30 (emphasis added).

⁶ HJR 9, Enrolled Copy (Utah 2009) at lines 85-89, available at <http://www.le.state.ut.us/~2009/bills/hbillenr/HJR009.pdf>.

106 A: These statutes provide the Commission with flexibility in designing just and reasonable
107 rates that are in the public interest. Additionally, in Docket No. 08-999-05, the Utah Public
108 Service Commission found that these two statutes, along with H.J.R. 9, were sufficient to support
109 the purposes of Title 1 of PURPA⁷ such that adoption of the PURPA Rate Design Standard (*see*
110 *below*) in Utah was redundant and therefore unnecessary.

111 **Q: What are the purposes of Title 1 of the Public Utilities Regulatory Policies Act**
112 **(PURPA)?**

113 A: Title 1 of PURPA established three purposes, namely the conservation of energy,
114 efficient use of facilities and resources by electric utilities, and equitable rates to electricity
115 consumers.⁸ In furtherance of these goals, in 2007, the Energy Independence and Security Act
116 (EISA) amended PURPA by adding, among other things, a rate design standard⁹ to Title 1,
117 Subtitle B of PURPA to encourage energy efficiency investments.¹⁰

118 **Q: What is the PURPA Rate Design Standard?**

119 A: Found in Section 2621(d)(17) of PURPA, “Rate design modifications to promote energy
120 efficiency investments,” states that electric utility rates shall (i) align utility incentives with the
121 delivery of cost-effective energy efficiency, and (ii) promote energy efficiency investments.
122 Specifically, regulatory authorities are to consider “including the impact on adoption of *energy*
123 *efficiency as one of the goals of rate design* recognizing that energy efficiency must be balanced

⁷ Public Utilities Regulatory Policies Act, 16 U.S.C. 46.

⁸ 16 U.S.C. 46, Section 2611.

⁹ 16 U.S.C. 46, Section 2621(d)(17).

¹⁰ For a brief background of PURPA and the 2007 amendments, see Docket No. 08-999-05, particularly the *Determination Concerning the PURPA Rate Design Standard*, issued December 16, 2009 by the Utah Public Service Commission.

124 with other objectives,” and “adopting *rate designs that encourage energy efficiency* in each
125 customer class.”¹¹

126 State regulatory commissions were tasked with determining whether it was appropriate to
127 implement the Rate Design Standard in order to carry out the purposes of PURPA, or whether
128 comparable standards had already been implemented.¹² Because the Utah Commission found
129 that comparable standards, which facilitated designing rates for encouraging energy efficiency,
130 had already been implemented in Utah, they declined to adopt the PURPA rate design standard.
131 Those policies, specifically, were the ones I mentioned above in lines 99-103.

132 **Q: What is your conclusion with regard to policies promoting energy efficiency and**
133 **conservation through rate design?**

134 A: I conclude that there is ample policy support in Utah to design and implement rates in
135 such a way that will send energy conservation price signals.

136

137 **RESIDENTIAL RATE DESIGN**

138 **Q: What role does residential rate design play in promoting energy efficiency?**

139 A: Residential rate design affects the price signals consumers receive from their energy bills
140 and can influence customer choices and energy consumption behaviors. A rate design that
141 collects more costs from volumetric energy rates conveys the message that increasing energy
142 consumption increases the costs of energy. Collecting revenues through volumetric rates further
143 reinforces energy conservation because consumers can more obviously benefit from energy
144 conserving behaviors and efficiency upgrades and investments and more quickly realize their

¹¹ 16 U.S.C. 46, Section 2621(d)(17)(B)(iii-iv) (emphasis added).

¹² Docket No. 08-999-05, *Order on the Determination Concerning the PURPA Rate Design Standard*, issued December 16, 2009 at 2.

145 returns on investment.

146 Rate designs that collect more costs through volumetric charges therefore send price
147 signals to conserve energy through behavior changes and investments in energy efficient homes
148 and technologies. The Regulatory Assistance Project says that recovering costs through
149 volumetric sales allows pricing structures that “reflect the long-term economic costs of serving
150 demand and preserves the linkage between consumers’ energy costs and their levels of
151 consumption.”¹³

152 In the interest of sending strong price signals for energy conservation and efficiency, it is
153 the position of Utah Clean Energy that the majority of utility revenues from the residential class
154 should be collected through volumetric rates and that volumetric rates should be more strongly
155 inverted.

156 **Q: What is the Company’s residential rate design proposal in this case?**

157 A: The Company proposes to increase the monthly customer charge by \$6.25 to \$10.00.
158 According to the Company’s calculation methodology, the current customer charge fails to
159 recover all of the Company’s fixed costs.¹⁴ Apart from shifting cost recovery to the monthly
160 customer charge, the Company proposes no substantive changes to residential energy charges or
161 the energy charge structure.¹⁵

162 In his direct Testimony, William R. Griffith explains, “In today’s environment where we
163 encourage reduction in usage where possible and attempt to achieve efficient usage in all

¹³ Wayne Shirley, Jim Lazar, and Frederick Weston, *Revenue Decoupling, Standards and Criteria: A Report to the Minnesota Public Utilities Commission* (June 30, 2008) at 5, available at http://raponline.org/docs/RAP_Shirley_DecouplingRevenueRpt_2008_06_30.pdf.

¹⁴ Direct Testimony of William R. Griffith at lines 87-99.

¹⁵ Direct Testimony of William R. Griffith at lines 82-83.

164 circumstances, it is not appropriate to achieve the recovery of fixed costs through the variable
165 energy components of rates.”¹⁶

166 **Q: William R. Griffith describes the ‘throughput incentive,’ which encourages utilities**
167 **to sell more kWh to recover its fixed costs through volumetric sales. Do you support his**
168 **conclusion that removing the throughput incentive with a higher fixed monthly customer**
169 **fee is appropriate?**

170 A: No, because increasing the customer charge blunts the price signals to conserve energy.
171 A higher fixed fee limits the ability to send price signals to conserve through volumetric charges
172 and inclining block rates. In fact, as discussed later in this testimony, it penalizes low energy
173 users by increasing their bills disproportionately compared to high energy users.

174 **Q: Given that you do not support a high monthly customer fee, are there other ways to**
175 **remove the throughput incentive?**

176 A: Yes, there are other business models that remove the throughput incentive. One such
177 mechanism is revenue decoupling, which has been successfully adopted for Questar Gas and was
178 proposed by the Division of Public Utilities and supported by Utah Clean Energy and SWEEP in
179 Rocky Mountain Power’s last general rate case.

180 **Q: Is Utah Clean Energy recommending decoupling in this rate case?**

181 A: No, we are not recommending decoupling in this rate case, but given that there is still
182 concern by the Company regarding the throughput incentive, we request that the Public Service
183 Commission establish a workgroup to analyze this issue.

184 **Q: Do you support either of the Company’s calculations of the monthly customer**
185 **charge?**

¹⁶ Direct Testimony of William R. Griffith at lines 102-104.

186 A: No, we support the Commission approved methodology for this case.

187 **Q: In addition to preserving price singles that encourage energy conservation, why else**
188 **is it appropriate to maintain a relatively low fixed fee?**

189 A: Although fixed costs are not variable in the short term, varying levels of energy usage can
190 impact the long term “fixed” costs of maintaining and updating the electric system. For
191 example, the need for distribution system upgrades is influenced by increasing demand.
192 Therefore, collecting the Company’s proposed amount of costs through the monthly customer
193 charge sends erroneous price signals about the longer term impacts of high energy use.
194 Therefore, in order to send the greatest possible price signal for consumers to reduce energy
195 consumption and invest in energy efficient technologies some “fixed” costs should be recovered
196 through volumetric rates.

197 Such a position is consistent with past Commission orders. Specifically, in the last
198 Rocky Mountain Power rate case, the Commission found that recovering costs for local
199 distribution facilities in the fixed fee, that is, equally from all customers regardless of usage, was
200 not equitable because it ignored differences in peak use.¹⁷ Increasing customer energy demand
201 puts increasing pressure on distribution systems, which can and does result in costly upgrades.
202 Furthermore, the Regulatory Assistance Project reports that increased consumption of electricity
203 carries environmental and reliability externalities and that these externalities and associated costs

¹⁷ Docket No. 09-035-23, In the Matter of the Application of Rocky Mountain Power for Authority to Increase its Retail Electric Utility Service Rates in Utah and for Approval of its Proposed Electric Service Schedules and Electric Service Regulations, *Report and Order on Rate Design*, issued June 2, 2010 at 30.

204 affect everyone else in society.¹⁸ It is not appropriate to send price signals that imply,
205 incorrectly, that all customers affect long-run costs to the same degree.

206 **Q: In Exhibit RMP___(WRG-6), the Company shows that, under its residential rate**
207 **design proposal, monthly energy charges increase by about 6% for all levels of residential**
208 **energy usage. Does this exhibit also show the projected monthly *bill* (customer charge plus**
209 **energy charge) increase across all residential energy use levels?**

210 A: No, while the exhibit implies that all customers are treated roughly equitably under the
211 Company's proposal, in fact, low energy users, who put less impact upon the system, are
212 penalized compared to higher energy users under the Company's proposal. Please refer to UCE
213 Exhibit 1.1D, where we calculated the absolute and percentage *bill* increases for the same usage
214 levels in RMP Exhibit___(WRG-6). UCE Exhibit 1.1D shows that low energy users, who use
215 400 kWh and below per month, have bill increases between 22 and 56 percent and that large
216 energy users, who use between 1,500 and 5,000 kWh per month have bill increases between 10
217 and 7 percent. Under this proposal, high energy users are rewarded compared to low energy
218 users.

219 **Q: Do you believe that the Company's proposal sends price signals to conserve energy?**

220 A: Clearly not; it does just the opposite. It rewards large energy users with a smaller rate
221 increase, despite their increased contribution to future costs. Furthermore, placing a significant
222 proportion of the rate increase in the customer charge hamstrings the ability to increase
223 volumetric energy charges to send price signals to encourage conservation.

¹⁸ Regulatory Assistance Project, *Issue Letter—Efficiency Regulation of the Distribution Utility: Where Rate Design and PBR Meet* (May 2001) at 5, available at http://raponline.org/docs/RAP_IssueLetter-EfficientRegulationOfDistributionUtility_2001_05.pdf.

224 **Q: Do you have a rate design recommendation for this rate case that provides clearer**
225 **conservation-promoting price signals?**

226 A: I recommend using the Commission-approved methodology of calculating the customer
227 charge. I also recommend setting the third block rate (a rate paid only by high volume
228 consumers) at no less than \$0.14/kWh.

229 **Q: Why do you recommend a tail block rate no less than \$0.14/kWh?**

230 A: As I discussed above, higher energy users put more demands on the system and
231 contribute more than low energy users to increased long-term costs. It is therefore appropriate to
232 set tail block rates at a level reflective of long run marginal costs. In its Marginal Cost Study,
233 prepared pursuant to Commission order in Docket No. 09-035-23, the Company calculated a 10-
234 year marginal cost for residential customers at just over \$0.135/kWh.¹⁹ Utah Clean Energy has
235 not evaluated the Company's marginal cost study methodology; nevertheless, the study provides
236 clear support for the position that there is cost-justification for increasing the tail block rate more
237 than the Company proposed in this case.

238 **Q: Will you summarize your conclusions and recommendations?**

239 A: Yes. I conclude that there is ample policy support in Utah to prioritize energy
240 conservation when designing rates for the residential class. I recommend use of the
241 Commission-approved methodology for calculating the monthly customer charge. I further
242 recommend that the third block be set at no less than \$0.14/kWh. I conclude that designing
243 residential rates in accordance with the foregoing will result in rates that send stronger price
244 signals to promote energy conservation and efficiency. Finally, Utah Clean Energy requests that

¹⁹ REDACTED Exhibit RMP____(CCP-5), page 1.2.

245 the Public Service Commission establish a workgroup to analyze the implications of the
246 throughput incentive and its impact on the utility, ratepayers, and energy efficiency.

247 **Q: Does that conclude your testimony?**

248 **A: Yes.**
