Subject: \$4.24 monthly fee from homeowners who have made personal investment in rooftop solar power

To: "rlwilson@utah.gov" <rlwilson@utah.gov>

To Whom It May Concern,

I would appreciate you forwarding this email, to the appropriate entity within your organization, as input to the rulemaking/hearing on the matter in the subject line of this email. (I apologize for sending this to yourself but have been unable to identify from the PSC's website where to provide input on this matter).

I am very much opposed to any fee on residential customers installing rooftop solar power. The articles in the media by Rocky Mountain power "justifying" such a fee seem not in the public interest and instead their arguments support increased profits for Rocky Mountain.

I would ask the Commission instead to undertake a study and implementation of increased subsidies for residentially and commercially installed solar as a way to reduce the need for more polluting power generating plants and solar installations by Rocky Mountain. This seems to be the way many other states and other countries help consumers pay for electrical services generating a pollution cost. Given the pollution problem in the Salt Lake Valley we need to encourage more rather than less residential solar power generation. The public's interest is not to increase Rocky Mountain's profitability but rather to decrease the power costs to consumers and industry.

Thank you

Marvin Goldstein,
