I am apposed to the proposed \$4.25 additional net metering fee. I have a solar system which generates more power than I use and Rocky Mountain Power gives me no reimbursement for that power because I am a residential property. Yet, they think they can charge me an additional charge without giving consideration for the extra power I generate. They also seem to forget that generating the power locally, especially during the summer, will help relieve peak power needs which reduces the need for expanding the infrastructure to bring the power into the local communities. This is a period where power usage and production is changing. This is similar to the changes which have occurred in the telephone industry. The utilities need to adapt to the changes and not penalize those who are helping produce clean power.

Thank you for consideration of these comments.
