

1 **Q. Are you the same Joelle R. Steward who presented direct testimony in this**
2 **proceeding?**

3 A. Yes.

4 **Q. Please provide an overview of your rebuttal testimony.**

5 A. My testimony responds to the direct testimony of Robert Davis on behalf of the
6 Division of Public Utilities (“DPU”), Philip Hayet on behalf of the Utah Office of
7 Consumer Services (“OCS”), and Tim Woolf and Ben Norris on behalf of Utah
8 Clean Energy, The Alliance for Solar Choice, and the Sierra Club (the “Joint
9 Parties”). Specifically, my testimony addresses the use of the cost of service study
10 by the DPU and OCS, and several aspects of the tests proposed by the Joint Parties.

11 **Q. Please summarize the Company’s proposal in this proceeding.**

12 A. The Company is proposing the adoption of a two-part framework for the
13 Commission to evaluate the costs and benefits of net energy metering (“NEM”), as
14 required by Utah Code Ann §54-15-105.1. The two parts of the framework are
15 comprised of (1) using avoided costs for the valuation of excess energy production
16 from NEM customers, and (2) a cost of service study in which NEM customers are
17 identified as a separate class from non-NEM residential customers to determine the
18 cost of serving the NEM customer. The cost of service study will also reflect
19 benefits to NEM customers where they may impose fewer costs on the utility
20 system. The Company’s proposed framework relies on tools, policies, and
21 procedures already adopted by the Commission to develop rates. Separating these
22 customers in the cost of service study will provide the necessary perspective to
23 determine what costs are necessary for serving NEM customers.

24 **Response to Mr. Davis for the DPU**

25 **Q. How does DPU witness Mr. Davis recommend calculating the costs and**
26 **benefits of the NEM program?**

27 A. Similar to the Company, Mr. Davis proposes using a cost of service based
28 framework. Specifically he proposes conducting two studies. In the first study, the
29 revenue requirement and the cost of service would consider the loads of NEM
30 customers without any distributed generation by assuming NEM customers were
31 full requirements customers. The second study would consider the revenue
32 requirement and cost of service that reflects NEM customers' net loads. The
33 difference in results between these two studies would, he argues, represent the
34 benefit of the NEM program in Utah and to specific customer classes.

35 **Q. Please comment on Mr. Davis' proposal.**

36 A. Like Mr. Davis' proposal, the Company's proposed framework relies upon the cost
37 of service study to evaluate the costs and benefits of the NEM program. While using
38 similar tools, I believe that the Company's proposed approach of creating a separate
39 class for NEM customers in the cost of service study will more effectively and
40 efficiently accomplish the goal of identifying the costs and benefits of NEM
41 customers, without the need for relying on estimated data to approximate a full
42 requirements customer or the complexities of preparing a second revenue
43 requirement. The Company's approach will also have a practical application for the
44 development of rates. Moreover, the Company disagrees with including excess
45 energy in the cost of service study, as proposed by Mr. Davis. The cost of service
46 study is designed to evaluate the cost of energy delivered to customers, not energy

47 supplied to the Company. Avoided cost is a better tool for calculating the value of
48 energy supplied to the Company. Utilizing these two tools, the Company's
49 approach differentiates the costs and benefits from NEM customers in their two
50 unique roles as a partial requirements customer and power producer.

51 Under the Company's approach, the differences attributable in the cost of
52 serving NEM customers can be observed by comparing the unit cost results (i.e.,
53 the \$/kWh costs related to generation, transmission, distribution, etc.) from the
54 residential NEM class in the study to the unit cost results for the full requirements
55 residential class. Where there are benefits, these will be apparent as lower unit costs
56 for NEM customers, which represent a lower cost to serve. More directly
57 calculating the actual cost to serve NEM customers through the Company's
58 proposed approach, rather than with the DPU's more indirect approach of using
59 two studies would allow for a more practical application of results and is consistent
60 with Commission established policies and practices for establishment of rates for
61 other types of customers.

62 **Q. Do you have concerns with the analytical requirements of the DPU's proposal?**

63 A. Yes. In order to perform the alternative revenue requirement and cost of service
64 study where NEM customers are considered full requirements customers, a
65 statistically significant sample of production interval meters would be needed to
66 measure the output of the customer's facility. The output from the customer facility
67 would then need to be compared to the measured usage at the Company's meter in
68 order to reliably determine the customer's full requirements usage. While the
69 Company is currently conducting a load research study on residential NEM

70 customers in Utah, the Company experienced difficulty in getting approval from
71 customers for the installation of production meters on customer facilities. The
72 Company can and has installed load research meters that measure energy supplied
73 to the NEM customer and energy exported to the grid on a 15 minute interval.
74 However, NEM customers are under no obligation to allow the Company to install
75 meters that measure the output of their generating facility. In order to effectively
76 rely on the DPU's proposed framework for rate setting purposes, the Commission
77 would have to require customers to allow the Company to install production meters
78 on their facilities, pursuant to U.C.A. §54-15-103(4). Therefore, the
79 implementation of the DPU's proposal would be far more challenging than the
80 methods proposed by the Company.

81 **Response to Mr. Hayet for the OCS**

82 **Q. What is your response to Mr. Hayet's testimony?**

83 A. First, I would note that Mr. Hayet also proposes a framework that relies on studies
84 with and without NEM customers. Like Mr. Davis, his approach would also require
85 the use of data from production meters in order to reliably measure the output of a
86 customer's facility to determine the full electricity usage of an NEM customer.

87 Second, Mr. Hayet recommends an approach that uses a shorter term
88 horizon and costs to be included for ratemaking purposes. Consistent with my
89 comments on Mr. Davis's proposal, the Company's approach to separately account
90 for NEM customers in the cost of service study would more directly and efficiently
91 accomplish the same goal.

92 **Response to Mr. Woolf for the Joint Parties**

93 **Q. On page 12 and 13 of Mr. Woolf’s testimony, he discusses different types of**
94 **“inequities that occur” with regulated utility rates. Are the situations that Mr.**
95 **Woolf enumerates comparable to the dilemma of potential cross-subsidization**
96 **of net metering?**

97 A. No. The situations that Mr. Woolf lists have occurred as long as regulated utilities
98 have existed and they should not be compared to the potential inequities that may
99 occur with net metering. In none of the situations that Mr. Woolf presents do
100 customers have the opportunity to significantly reduce their utility bill while still
101 substantially relying upon the utility’s system. I think that each of his examples
102 simply demonstrate that the Company charges customers rates that are based upon
103 average costs. Some customers may be more costly to serve than others, but the
104 Company cannot charge every individual customer a different rate. However,
105 customers are assigned to different classes in the cost of service study and are made
106 subject to different rate schedules when a group of customers shares similar
107 characteristics of their service. For example, irrigators are in their own class in the
108 cost of service study and are subject to Schedule 10. They tend to use power almost
109 exclusively during the growing season and have a seasonal pattern of energy usage
110 that is unlike any other class in the cost of service study. Distributed generation is
111 a fundamentally new way that customers can use the utility system. It is important
112 that rates for this new type of customer fairly reflect their costs.

113 **Q. On pages 14 and 15 of Mr. Woolf’s testimony, he lays out several reasons why**
114 **he believes that the Utility Cost Test should be used to evaluate the NEM**
115 **program. Please comment.**

116 A. The Utility Cost Test is an important tool for determining the cost effectiveness of
117 resource acquisition. However, it is not used to set rates. As I discussed in my direct
118 testimony, rate design is an essential element of the NEM program. Ultimately the
119 NEM statute requires the governing authority to “determine a just and reasonable
120 charge, credit, or ratemaking structure, including new or existing tariffs, in light of
121 the costs and benefits.” The Company’s proposal is better suited to meet the rate
122 setting emphasis and requirements of the mandate. Its two-part approach utilizes
123 the cost of service study, which is currently used to guide the rates that retail
124 customers pay, and avoided costs which develop the prices that the Company pays
125 to QFs for the output of their generation.

126 **Q. Do you believe that DSM programs are directly comparable to net metering?**

127 A. No. As I discussed on pages 13 and 14 of my direct testimony, there are important
128 differences between DSM programs commonly evaluated by the Utility Cost Test
129 and the NEM program. The reduction in customer load from conservation measures
130 occurs at the same time that a customer is using energy which is in contrast to
131 distributed generation which may or may not produce energy at the time that the
132 customer requires it. NEM customers only reduce their *purchase* of electricity from
133 the Company, not their demand or consumption of electricity. They use the utility
134 system differently, relying on it for backup and facilitation of excess output.

135 Additionally, the incentives paid to participants and the administrative costs
136 of DSM programs are recovered through a separate surcharge outside of the base
137 ratemaking process. Generally DSM participants are paid one-time financial
138 incentives for the measures that they take. In contrast, the primary incentive for

139 NEM is the reduction in the NEM customer's bill and the full retail energy rate
140 credits that they receive for excess generation. The cost of the NEM program is not
141 explicitly paid for in a separate surcharge nor is there any specific allocation of the
142 costs of the NEM program within the cost of service study. The cost recovery of
143 the NEM program is simply captured in the overall rates that retail customers pay.

144 In light of these key differences, using the Utility Cost Test, while a good
145 tool for resource planning purposes, is not the correct way to calculate the costs and
146 benefits of the NEM program to "determine a just and reasonable charge, credit, or
147 ratemaking structure, including new or existing tariffs" as required by Utah Code
148 Ann §54-15-105.1.

149 Moreover, the Company agrees with Mr. Davis that using the DSM tests,
150 including the Utility Cost Test, would require modifications, and therefore, would
151 no longer be the same test as used for DSM. For instance, in order to conform with
152 the NEM law that requires an analysis that reflects the costs and benefits to the
153 Company as well as other customers, the Utility Cost Test that Mr. Woolf uses
154 would need to include the fixed cost recovery that is shifted to other customers,
155 which would result in using the Rate Impact Measure ("RIM") test.

156 **Q. Mr. Woolf argues that the RIM test, and in particular, existing costs that may**
157 **be shifted to other customers (which he refers to as lost revenue) should not be**
158 **used as part of any analysis because the existing costs are recovered from**
159 **customers regardless of whether NEM exists. How do you respond?**

160 **A.** I couldn't disagree more. The cost shift from NEM impacts other customers in the
161 form of higher rates that are needed to recover those fixed costs. As a matter of

162 equity, it's necessary to consider which customers are paying the fixed costs, not
163 just whether or not they are being recovered. The Company's proposed framework
164 of using the cost of service study will determine if NEM customers are fairly paying
165 the costs necessary to serve them.

166 **Response to Mr. Norris for the Joint Parties**

167 **Q. Do you agree with Mr. Norris' method of estimating avoided transmission and**
168 **distribution losses?**

169 A. No. While I agree that line losses should be captured to calculate the cost of serving
170 NEM customers and that the benefits of the excess output should reflect avoided
171 losses, Mr. Norris' way of calculating them is unduly complex. He recommends
172 that losses be calculated for every hour and on a marginal basis. This would be a
173 divergence from the way the Company calculates and uses losses to set rates for
174 other customers. For ratemaking purposes, the Company calculates line losses on
175 an average not a marginal basis. The line loss factors which the Company uses were
176 developed by an outside consultant. To develop hourly loss factors would
177 potentially require engaging a consultant for a new costly study.

178 On page 12 of his testimony, Mr. Norris recommends that the calculation of
179 avoided losses should consider the non-linear relationship between losses and load.
180 He makes the statement, "For example, the total load-related losses during an hour
181 with a load of 2X would be approximately 4 times the total load-related losses
182 during an hour with a load of only X." In the cost of service study, the Company
183 uses different loss factors for energy and peak load. This already captures some of

184 the differences between losses that occur on average and at the time of peak. Table
185 1 shows the loss factors which were used in recent cost of service study filings:

Table 1. Line Loss Factors

Voltage Level	Energy Loss Factor	Demand Loss Factor
Secondary	9.32%	10.11%
Primary	6.63%	7.38%
Transmission	4.53%	4.26%

186 The different values for loss factors presented in Table 1 show that the estimated
187 losses at the time of peak demand are not orders of magnitude larger than the
188 average energy-related loss factors as Mr. Norris seems to suggest they might be.
189 Determining losses on a marginal basis and for each hour is unnecessary.

190 **Q. Lastly, Mr. Norris advocates for a jurisdictional allocation benefit.**
191 **Considering the other benefits that Mr. Norris presents, should additional**
192 **benefits be given for inter-jurisdictional allocations?**

193 A. No. Mr. Norris' recommendation would double count generation and transmission
194 costs that he already included in other benefit categories. Inter-jurisdictional
195 allocations are used to allocate shared costs such as generation, transmission, and
196 customer services amongst the states which PacifiCorp serves. Distributed
197 generation can potentially reduce the allocation of generation and transmission
198 costs for a jurisdiction, but his methodology already considers the potential benefits
199 of reduced energy and capacity on generation and transmission costs. It would be
200 inappropriate to calculate this benefit twice.

201 **Q. Please summarize your rebuttal testimony and proposed framework.**

202 A. The Company's proposed framework uses tools already established by the
203 Commission and is consistent with how rates are set for other customers. The
204 Company's proposed framework is similar to those proposed by the DPU and OCS
205 in that it relies on the cost of service study and reflects near term costs, but is a more
206 direct approach by calculating the cost of serving NEM customers, which can be
207 compared to the cost of serving non-NEM customers. Additionally, this more direct
208 approach will have practical application for the development of rates. The
209 framework proposed by the Joint Parties requires greater complexity, speculation
210 for future costs and benefits, and ignores the cost shift for recovery of fixed costs
211 that occurs from net metering due to the existing residential rate design. And
212 because it is a long-term view of costs and benefits, it ignores the Commission's
213 direction that "any cost or benefit to be included ... must be a cost or benefit that
214 has some impact on the utility's cost of service."¹

215 **Q. Does this conclude your rebuttal testimony?**

216 A. Yes.

¹ *In the Matter of the Investigation of the Costs and Benefits of PacifiCorp's Net Metering Program*, Docket No. 14-035-114, Order Re: Conclusions of Law on Statutory Interpretation and Order Denying Motion to Strike, p. 15 (July 1, 2015).
