

BEFORE THE PUBLIC SERVICE COMMISSION OF UTAH

In the Matter of the Voluntary Request of)	
Rocky Mountain Power for Approval of)	Docket No. 14-035-147
Resource Decision and Request for)	DPU Exhibit 4.0 DIR
Accounting Order)	

REDACTED

DIRECT TESTIMONY

OF

ROBERT A. DAVIS

ON BEHALF OF THE

UTAH DIVISION OF PUBLIC UTILITIES

March 17, 2015

TABLE OF CONTENTS

I.	INTRODUCTION	2
II.	PURPOSE AND SUMMARY OF TESTIMONY	3
III.	BACKGROUND	4
IV.	BUSINESS PLAN SCENARIOS	5
V.	UMWA PENSION WITHDRAWAL	9
VI.	CONCLUSIONS AND RECOMMENDATIONS	13

1 **Introduction**

2 **Q: Please state your name and occupation.**

3 **A:** My name is Robert A. Davis. I am employed by the Division of Public Utilities
4 (Division) of the Utah Department of Commerce as a Utility Analyst in the Energy
5 Section.

6 **Q: What is your business address?**

7 **A:** My business address is 160 East 300 South, 4th Floor, Salt Lake City, Utah, 84114.

8 **Q: On whose behalf are you testifying?**

9 **A:** The Division.

10 **Q: Do you have any exhibits that you are filing along with your testimony?**

11 **A:** Yes I do. Exhibit DPU 4.1 is a confidential spreadsheet prepared by PacifiCorp,
12 dba Rocky Mountain Power (Company) in response to the Division's data request DPU
13 1.1 on December 22, 2014.

14 **Q: Please summarize your educational and professional experience.**

15 **A:** I received a Master's in Business Administration with Master's Certificates in
16 Finance and Economics from Westminster College in May of 2005. I am a Certified
17 Valuation Analyst (CVA) by the National Association of Valuators and Analysts and an
18 Accredited Senior Appraiser (ASA) by the American Society of Appraisers. In addition, I
19 am a Certified General Appraiser in the State of Utah. I have been employed with the

20 Division since May of 2012 where I have worked on various telecommunications and
21 energy related projects such as general rate cases, tariff adjustment requests, action
22 requests from the Commission and other cases where auditing, financial and economic
23 analysis is needed.

24 Prior to my present position, I was employed for seven years at the Utah State
25 Tax Commission in the Centrally Assessed Property Tax Division-Utilities Section where I
26 assessed telecommunication, energy and airline companies for property tax purposes.

27 Prior to working for the Property Tax Division, I was employed as an Electronic
28 Engineering Technician at Fairchild Semiconductor for 22 years.

29 **Q: Have you testified before the Commission on prior occasions?**

30 **A:** Yes I have.

31 **Purpose and Summary of Testimony**

32 **Q: What is the purpose of your testimony in this proceeding?**

33 **A:** My testimony addresses two components of this proceeding. First, the
34 Company's three Net Present Value (NPV) business plan scenarios: (1) keep the Deer
35 Creek (Mine) open along with related Mine assets and continue to operate them until
36 the Mine's estimated closure in 2019 ("Keep Case"); (2) close the Mine now and
37 purchase coal on the open market ("Market Case"); or (3) close the Mine now, sell the
38 mining assets and enter into a transaction with Bowie Resource Partners, LLC (Bowie)
39 ("Transaction Case").

59 resources to meet the BTU and other quality demands [1] of the Huntington and Hunter
60 power generating plants. To facilitate how to best proceed forward, the Company
61 utilizes NPV scenario analysis to determine the best option with the lowest revenue
62 requirement.

63 The other driving factor mentioned above is the UMWA Pension Plan liability risk
64 going forward. As a participant of the multi-employer pension pool, EW is exposed to
65 substantial risk from annual payment increases as other participants in the pool
66 withdraw for whatever reason. Even if this were not the case, the required payment per
67 hour worked used to fund the pension is scheduled to increase significantly going
68 forward as shown in confidential Exhibit DPU 4.1. This increase will likely become
69 troublesome from a cost/benefit perspective as the pension payments will exacerbate
70 the costs of operating the Mine beginning in June of 2015 and escalating thereafter. EW
71 currently pays approximately [REDACTED] per year. If the deal does not conclude prior to
72 June 1, 2015, this annual payment will likely increase significantly.

73 **Business Plan Scenarios**

74 **Q: Will you briefly explain the Division's interpretation of the three NPV scenario analysis**
75 **as presented by Ms. Crane in her Direct Testimony and Exhibit RMP (CAC-7)?**

76 **A:** Yes I will. As mentioned above, the Company analyzed three NPV scenarios: Keep

1 See the Direct Testimony of Cindy A. Crane at lines 456-491. Concerns with high ash and sulfur coal content, incremental cost increases associated with the long-wall operation, inventory issues relating to the high ash and sulfur coal content to name a few.

77 Case, Market Case and the Transaction Case. The results of each of these scenarios are
78 compared to each other to arrive at the scenario that produces the lowest revenue
79 requirement based on the assumptions [2] used for the analysis.

80 The three scenarios utilize the same assumptions throughout with the exception
81 of the costs associated with each scenario noted in Ms. Crane's Exhibit RMP (CAC-7). In
82 addition to those assumptions listed in Ms. Crane's exhibit, the rate for the NPV
83 analysis, time horizons (2029, 2036 and 2042), tax rate and pension annuity payments
84 are held constant for each scenario.

85 **Q: Will you explain the Division's position, as far as reasonableness, of the scenario**
86 **analysis presented by the Company?**

87 **A:** Yes. It is the Division's understanding that the Company utilizes the costs
88 associated with each scenario based on the Company's best known forecasts of what
89 the conditions will be going forward. As in any analysis, the analysis here is only as good
90 as the assumptions used. If any of these costs were to change going forward, the
91 analysis would likely produce different results possibly leading to a different conclusion.
92 Without a certain depth of auditing the forecasted costs used for the scenarios, the
93 Division can only assume that they are accurate and reasonable. The Division is not
94 aware of any sensitivity analysis that was performed to arrive at the forecasted numbers
95 as a result of these uncertainties. This additional probability forecasting step in the

2 See Cindy A. Crane Exhibit RMP (CAC-7).

96 Company's analysis likely would have provided a more convincing outcome.

97 Scenario analysis can be accomplished using many different methods, from
98 simple to complex. The two most common methods used are Discounted Cash Flow
99 (DCF) and NPV as used by the Company for this proceeding. The difference between DCF
100 and NPV analysis is that in NPV analysis, the discounted cash flow stream is netted
101 against a current period number, usually negative, signifying a cash outlay. Usually, if
102 the net number is positive, then the outcome is a desirable option. If the outcome is
103 negative, then it is a less desirable option. Using this number to compare different
104 scenarios leads to the scenario of choice. In this proceeding, the Company's analysis
105 identifies from among the scenarios the one that produces the lowest revenue
106 requirement.

107 The cash flow stream to be discounted can be in any number of formats. [3] The
108 important principle is that the rate used to discount the cash flows over the time
109 horizon matches the cash flow stream (i.e., an after tax rate is used with an after tax
110 cash flow stream). There is normally a terminal value at the end of the time horizon
111 used to emulate what the cash flow stream would be into perpetuity, which is
112 discounted back to the current period. Each cash flow stream can occur at the beginning
113 of the period, at the end of the period or as in most cases, mid-year. This has an impact

3 The most typical cash flow stream is the after tax cash flow to invested capital which is developed by starting with Net Income, adding Non-Cash Charges plus Interest (Net of Tax Benefit) plus Dividends less Capital Expenditure less the Working Capital to support growth.

114 on the outcome, as NPV and DCF are based on the time value of money.

115 The Company did not perform its NPV analysis in the manner described above.
116 Instead, it performed a Present Value (PV) calculation using the Company's after-tax
117 Weighted Average Cost of Capital (WACC) [4] for each pre-tax cost line item over the
118 time horizons mentioned above. The Company used a half-year convention in its
119 analysis by multiplying a factor [5] to the current PV of the cost stream over the time
120 horizon. The PV was not netted against a current period number, technically, making it a
121 DCF rather than a NPV. Additionally, other than the possible pension annuity, there are
122 no other costs that run for indeterminate periods, negating the need for a terminal
123 value. The results of each of these line item PV costs are summed for each scenario,
124 which are then used to weigh the scenarios against one another. This is how the
125 Company determines the optimal scenario. The 2042 time horizon is used in the final
126 analysis.

127 The Division finds the method and outcome to be reasonable given the assumed
128 correctness of the assumptions used in the modeling.

129 **Q: Does the Division have issues with the method in which the Company performed its**
130 **analysis even though it finds it reasonable?**

131 **A:** Yes. There are enough uncertainties in the assumptions that some level of

4 The Company used a rate that was representative of all the states in which it operates as opposed to the most current General Rate Case here in Utah. The difference is not significant.

5 The factor is $1 + (\text{Discount Rate}/2)$

132 probability forecasting should have been used. Given more time, the Division would
133 have liked to ascertain some level of certainty to the correctness of the numbers used in
134 the analysis. The method of analysis is somewhat unorthodox but effective in
135 determining an optimum scenario in this proceeding. For example, changing any of the
136 assumptions that are shared by all the scenarios does not change the overall outcome.
137 In another context, the Division may have rejected this method as being fundamentally
138 flawed. However, all things considered as presented in this proceeding, the analysis
139 leads to the Transaction Case as the lowest cost choice among the options evaluated.
140 The numbers used in the NPV analysis are not believed to be used in the accounting
141 treatment of the transaction.

142 **UMWA Pension Withdrawal**

143 **Q: Will you briefly explain the Division's interpretation of the UMWA Pension Plan**
144 **withdrawal?**

145 **A:** Yes. EW contributes to the 1974 Pension Trust based on the terms of the
146 National Collective Bargaining Agreement between the UMWA and Bituminous Coal
147 Operators' Association (BCOA). The Division is unaware of how much, if any, EW can
148 negotiate the price per hour worked in this agreement. In this multi-employer pension
149 plan, assets are pooled such that contributions may be used to provide benefits to
150 employees of other employers participating in the plan. The pension covers the retired
151 workers, disabled workers and spouses of workers for the rest of their lives. If an

152 employer withdraws from the plan for whatever reason, the employer would be
153 obligated to pay a withdrawal liability based on the entire participant's unfunded vested
154 benefits in the plan. The Division understands this to mean that as more and more
155 participants withdraw from the fund, the obligation to keep the fund fully vested falls to
156 those remaining in the plan. This could have exponentially increasing liability risk factors
157 to the employer participants remaining in the pension plan.

158 The financial condition of the 1974 Pension Trust has deteriorated dramatically
159 since the start of the 2007 National Bituminous Coal Workers Agreement (NBCWA). As
160 of June 30, 2006, the market value of the assets was [REDACTED] and the present value of
161 the vested benefits was [REDACTED] or a deficit of [REDACTED]. Mr. Schwartz, in his
162 Exhibit RMP (SS-4), now shows that deficit to be [REDACTED] as of June 2013. [6]

163 The Division has no reason to believe this deficit to be overstated or
164 understated. EW's obligation to continue paying into the plan under the "Keep Case" or
165 what the Company's withdrawal obligation will be under the proposed "Transaction
166 Case" or "Market Case", where the Mine will be closed, is of concern. My Confidential
167 Exhibit DPU 4.1 shows the current rates per hour worked as [REDACTED] through June of 2016.
168 This rate increases to [REDACTED] beginning June of 2017, to [REDACTED] in June of 2018 and to
169 [REDACTED] in June of 2019 during the year the Mine is scheduled to close. [7] This is the
170 amount added per hour to the employee's normal wage and other benefits per hour.

6 See the Direct Testimony of Seth Schwartz at lines 192-198.

7 See Exhibit DPU 4.1, "Company Confidential UWMA Withdrawal Liability.xlsx".

171 This fact alone, demonstrates the potential payroll liability to the Company and its
172 ratepayers if the Mine were to be kept open. The annual payment at that time would be
173 EW's obligation until the plan is exhausted of beneficiaries in the future.

174 **Q: Please explain how the current annual pension annuity payment is derived.**

175 **A:** The current annual annuity payment is based on two parts. The first part is a
176 three-year "running average of hours worked" beginning in June of 2005 from the prior
177 three years. The second portion is determining the highest hours worked within the
178 previous ten-year look back of the three year running averages. The next period forecast
179 of the ten-year look back is then multiplied by the current contribution rate per hour to
180 determine the annual payment going forward. Currently this is [REDACTED] times [REDACTED]
181 hours or [REDACTED]. [8]

182 **Q: Please explain how the current annual payment translates into the potential**
183 **withdrawal obligation.**

184 **A:** The [REDACTED] annual payment can be determined on a "today" amount by
185 simply dividing the amount by a discount rate, which is usually predetermined such as
186 the 30 year Treasury rate. At the time of the Company's filing, EW had used a Treasury
187 rate of 3.0848 percent. This equates to a PV of [REDACTED] or [REDACTED] rounded.

188 Worth noting is that a slight change in the rate, either up or down, will lead to a
189 significant change in the outcome of this calculation. For example, if the rate was 2.8848

8 Id.

190 percent, the PV would be [REDACTED] million. If the rate was 3.2848 percent, the PV would be
191 [REDACTED] million. As demonstrated, the PV is very sensitive to changes in the rate given the
192 same annual payment.

193 EW has three options to withdraw from the Pension Plan upon closure of the
194 Mine. The first option is to keep paying the annual payments, which would be set at the
195 time the last union employee is no longer on the payroll. The second option is to pay a
196 lump sum, which would be determined by the Pension Trust and is currently unknown
197 until toward the end of 2015. EW estimates the lump sum to be approximately [REDACTED]
198 [REDACTED] if it would have withdrawn from the Plan between June 2013 and July of 2014.
199 The Division's understanding is that even if EW chooses this option, the Trust could,
200 within three years, demand more payment. The third option is a negotiation between
201 EW and the Trust to set a lump sum based on the annual payments and terminal value.
202 If EW is successful in negotiating this option, EW would be totally withdrawn from the
203 Pension Plan. This amount would become a fixed amount and could be amortized over a
204 determined time horizon.

205 **Q: Does the Division believe EW is proceeding in this component of this proceeding in a**
206 **manner that is in the public best interest?**

207 **A:** Yes. However, given the uncertainty of how the pension withdrawal payment
208 amount will be determined, the Division cannot speculate what that number might be
209 today. Therefore, the Division recommends that the Pension Plan withdrawal liability be

210 addressed in the next general rate case and adjusted at that time, if it is known at that
211 point. Currently, the [REDACTED] is already in rates as part of fuel expense. This expense
212 should not be adjusted until the point in time where the actual liability is known.

213 The Division believes the Company is moving forward in the public interest given
214 its assumptions of what the Pension Trust may determine EW's liability to be. Given the
215 liability risk stated above, the Division does not believe that option two stated above,
216 the [REDACTED] lump sum, is in the public interest and should be avoided. The
217 Division believes the option to make a negotiated lump sum payment based on the
218 annual payments would be optimal. In any event, the current [REDACTED] annual
219 payment is known and in rates. Any changes in the annual payment up or down should
220 be addressed in the next general rate case. [9]

221 **Conclusions and Recommendations**

222 **Q: Please summarize the Division's recommendations.**

223 **A:** The Division has concerns regarding the methods used in the construction of the
224 NPV scenario analysis. However, by keeping shared assumptions between the scenarios
225 constant, the results would generally point to the same conclusion as one based on the
226 assumptions specific to each scenario. The Division believes, based on this component
227 of the proceeding that the "Transaction Case" is the best choice. [10]

228 The uncertainties surrounding the withdrawal liability of the 1974 Pension Plan

9 See Utah Code Ann. § 54-17-402 (4) (b) and 54-17-403 (1) (b).

10 See Utah Code Ann. § 54-17-402 (3) (b) (i).

229 are too vague at this time. The only known amount is the current annual payment. Until
230 the Trust determines EW's withdrawal liability toward the end of 2015, too much
231 uncertainty surrounding the amount exists to recommend a pre-approval. Rather, the
232 Division recommends that the Pension withdrawal liability be addressed in the next
233 general rate case when the actual number is known.

234 **Q: Does this conclude your direct testimony?**

235 **A:** Yes it does.
