Hello,

thank you for providing an opportunity to make changes to our future power sources. I disagree with allowing PacifiCorp to continue "investing" in obsolete coal-fired plants without considering large scale renewable projects. Advances in storage technologies, photovoltaics wind and geothermal are now capable of providing a strong solution to our power requirements. Why not get in early on the solution to our future energy needs, instead of being the last one on a sinking ship in an ocean of fossil fuels....that ocean level being driven by our obsession with outdated technology. It's quite reasonable to think that there will be a carbon tax or similar emissions regulation on coal-power in the near future and the economics of the decision you are about to make will far more obvious.

Please make the right choice for our future energy and air quality needs by rejecting this new investment in coal.

Iain
