We need to invest in utility-scale wind and solar that will meet Utah's energy needs without relying on coal. PacifiCorp's plan for the next 20 years would fetter investment dollars to coal—a really backwards-looking energy plan, in my view, when so many indicators point to renewable energy sources as viable now and becoming cheaper and cheaper each year.

While individual families will likely continue to invest in solar energy over the coming decades, an ideal role for PacifiCorp to play in the transition to renewables is an upkeep and cost-reducing middleman. By concentrating skills and investment in larger-scale solar (and wind) installations, our communities would benefit from cheaper, well-maintained, green projects.

Please reject PacifiCorp's coal-oriented energy investment portfolio and instead require an alternate plan that emphasizes renewables in the future. Thank you!
