Sophie Hayes (12546) Utah Clean Energy 1014 2nd Ave. Salt Lake City, UT 84103 801-363-4046 *Attorney for Utah Clean Energy*

BEFORE THE PUBLIC SERVICE COMMISSION OF UTAH

In the Matter of Rocky Mountain Power's Proposed Tariff Revisions to Electric Service Schedule No. 37, Avoided Cost Purchases from Qualifying Facilities	D оскет No. 17-035-Т07
In the Matter of Rocky Mountain Power's 2017 Avoided Cost Input Changes Quarterly Compliance Filing	D оскет No. 17-035-37

DIRECT TESTIMONY OF KEN DRAGOON

ON BEHALF OF

UTAH CLEAN ENERGY

October 3, 2017

RESPECTFULLY SUBMITTED, Utah Clean Energy

Sophie Hayes Attorney for Utah Clean Energy

1 **INTRODUCTION**

2	Q:	Please state your name and business address.
3	A:	My name is Ken Dragoon. My business address is 3519 NE 15th Avenue, #227,
4		Portland, Oregon 97212.
5	Q:	By whom are you employed and in what capacity?
6	A:	I am the Director and proprietor of Flink Energy Consulting LLC, a private
7		consulting business whose mission is to advise a diverse clientele on matters
8		relating to electric power planning and analysis, specializing in issues relating to
9		renewable energy sources.
10	Q:	On whose behalf are you testifying?
11	A:	I am testifying on behalf of Utah Clean Energy (UCE).
12	Q:	Please provide your professional experience and qualifications.
13	A:	I am the Director and proprietor of Flink Energy Consulting LLC. I began Flink
14		Energy in October 2014; however my career in the power industry is in its fourth
15		decade, having started at the Bonneville Power Administration (BPA) in 1982. I
16		worked at BPA in a number of capacities until 1996, ranging from power system
17		planner and hydro modeling to risk management and runoff forecasting. After
18		BPA, I worked for PacifiCorp, also in a number of capacities that included
19		contract pricing and structuring analysis, risk management, power system
20		modeling, and renewable resource acquisitions. I performed PacifiCorp's first
21		wind integration cost study for its 2003 IRP. After nine years at PacifiCorp, I
22		spent four years at Renewable Northwest Project (now Renewable Northwest) as
23		their Research Director, primarily working on wind integration and integration

24		cost issues. I spent two years each at the Northwest Power and Conservation
25		Council and at Ecofys, a sustainable energy consulting firm headquartered in The
26		Netherlands. I hold a master's degree in physics from the University of New
27		Hampshire, 1982.
28	Q:	Have you testified previously before this Commission?
29	A:	Yes, I testified on behalf of the Utah Clean Energy regarding PacifiCorp's
30		Capacity Factor Approximation Method (CFAM) in Docket 14-035-140 in 2015.
31		
32	POS	ITION & RECOMMENDATIONS
33	Q:	Please summarize your position in this matter.
34	A:	PacifiCorp contends that limiting Qualifying Facility (QF) avoided cost capacity
35		payments to the deferral of Integrated Resource Plan (IRP) preferred portfolio
36		resources of the same type results in "the most reasonable forecast of avoided
37		costs." To the contrary, PacifiCorp's proposed method will very likely lead to
38		avoided cost payments that violate FERC's principles to establish avoided costs
39		that are "just and reasonable to the electric consumer of the electric utility" and
40		that do "not discriminate against qualifying cogeneration and small power
41		production facilities. ¹ "
42		In this docket, the Commission must determine how to address rates for
43		renewable QFs that have the potential to displace renewable resources of differing
44		types, which is an issue that has not been directly addressed before by this
45		Commission. This is a complicated issue, and in this testimony I recommend that

¹ Order on Phase II Issues, DOCKET NO. 12-035-100 (August 16, 2013), pp 4-5.

46		the Commission not accept PacifiCorp's proposal to determine avoided costs
47		based on deferring only resources of similar technologies in the IRP preferred
48		portfolio. PacifiCorp's proposal will result in unjust and unreasonable avoided
49		cost rates and discriminate against QFs of all resource types. In this testimony I
50		also make recommendations for calculating avoided costs when the IRP calls for
51		diverse resources.
52		
53	PRO	XY/PDDRR METHOD AND COMMISSION'S ORDER IN 12-035-100
54	Q.	Please describe the Proxy/PDDRR method as it was approved in Docket No.
55		12-035-100.
56	A.	The Proxy/PDDRR method is a two part method for determining avoided costs.
57		As approved for qualifying facilities deferring thermal resources, during the
58		sufficiency period, avoided costs are determined by adding a resource to the
59		GRID model with zero cost energy and observing the calculated reduction in
60		revenue requirements, which are taken to be the avoided costs of the added QF.
61		During the deficiency period, in addition to avoided energy costs derived from
62		differential GRID runs, avoided capacity costs are taken as the capital (and non-
63		fuel operations and maintenance expenses) of the next deferrable (thermal)
64		resource added to the system in PacifiCorp's Integrated Resource Plan (IRP)
65		preferred portfolio. The capacity cost payment for a renewable QF is adjusted to
66		account for the renewable resource's capacity value relative to a thermal resource.
67		In Docket 12-035-100, the Commission also addressed what happens
68		when a renewable resource is able to defer an IRP resource of its same type. The

69		Commission found, "When PacifiCorp's IRP planned resources include a cost-
70		effective renewable resource of the same type as the QF, avoided cost capacity
71		payments under Schedule 38 shall be based on the capital costs of the next
72		deferrable resource of the same type in PacifiCorp's IRP planned resources." ² In
73		this case, the renewable QF's capacity payment is not adjusted for capacity value,
74		because its resource attributes are the same as the proxy resource. ³
75		To the best of my knowledge, this Commission has not addressed an
76		avoided cost pricing method to employ for a renewable QF displacing an IRP
77		renewable resource of a <i>different type</i> , or what to do when an IRP preferred
78		portfolio calls for diverse resources in the same year. Therefore, the current IRP,
79		which calls for new wind and solar resources, as well as new gas resources,
80		presents issues that are new to this Commission in terms of avoided cossts.
81		
82	PAC	IFICORP'S PROPOSED AVOIDED COST METHODOLOY
83	Q:	What is your understanding of PacifiCorp's proposed changes to the
84		Proxy/PDDRR method for calculating Schedule 38 avoided costs?
85	A:	In the Direct Testimony of Daniel MacNeil for PacifiCorp, Mr. MacNeil states
86		that limiting the current Proxy/PDDRR methodology to deferral of "cost-effective
87		renewable resources from the IRP preferred portfolio by QFs of the same type
88		produces the most reasonable forecast of avoided cost." That is, PacifiCorp is
89		proposing that wind QFs may only defer wind resources, solar resources may only

² Commission Order in docket 12-035-100, August 16, 2003 page 20.

³ Ibid.

90		defer solar resources, etc. However, the testimony appears unclear exactly how
91		the Company proposes to implement that policy. For example, PacifiCorp may be
92		proposing to eliminate the ability of one renewable resource to defer a non-like
93		renewable resource if a "like" renewable resource does not appear in the IRP. Or
94		PacifiCorp may be proposing to eliminate the ability of a renewable resource to
95		defer any non-like resource, including a thermal resource if a "like" resource is
96		called for later in the IRP. For example, if the IRP called for a gas plant in 2025,
97		wind in 2028, and solar in 2031, would a solar QF be able to defer the gas plant in
98		2025? These questions do not seem to be directly addressed in PacifiCorp's
99		testimony.
100	Q:	Are there practical implications of one or the other of these interpretations?
100 101	Q: A:	Are there practical implications of one or the other of these interpretations? Yes, both interpretations are problematic. In the first case, where no proxy
101		Yes, both interpretations are problematic. In the first case, where no proxy
101 102		Yes, both interpretations are problematic. In the first case, where no proxy resource displacement is allowed except for a like resource in the IRP portfolio,
101 102 103		Yes, both interpretations are problematic. In the first case, where no proxy resource displacement is allowed except for a like resource in the IRP portfolio, then PacifiCorp's proposal effectively provides for multiple
101 102 103 104		Yes, both interpretations are problematic. In the first case, where no proxy resource displacement is allowed except for a like resource in the IRP portfolio, then PacifiCorp's proposal effectively provides for multiple sufficiency/deficiency periods depending on resource type, which is a completely
101 102 103 104 105		Yes, both interpretations are problematic. In the first case, where no proxy resource displacement is allowed except for a like resource in the IRP portfolio, then PacifiCorp's proposal effectively provides for multiple sufficiency/deficiency periods depending on resource type, which is a completely novel, confusing, and unsupported re-definition of the deficiency period.
101 102 103 104 105 106		Yes, both interpretations are problematic. In the first case, where no proxy resource displacement is allowed except for a like resource in the IRP portfolio, then PacifiCorp's proposal effectively provides for multiple sufficiency/deficiency periods depending on resource type, which is a completely novel, confusing, and unsupported re-definition of the deficiency period. On the other hand, if PacifiCorp (rightly) allows renewable resources to
101 102 103 104 105 106 107		Yes, both interpretations are problematic. In the first case, where no proxy resource displacement is allowed except for a like resource in the IRP portfolio, then PacifiCorp's proposal effectively provides for multiple sufficiency/deficiency periods depending on resource type, which is a completely novel, confusing, and unsupported re-definition of the deficiency period. On the other hand, if PacifiCorp (rightly) allows renewable resources to displace thermal generation, it seriously calls to question the contention that

111	Q:	What underlies PacifiCorp's argument that displacing only resources of
112		similar types results in the most accurate forecast of costs?
113	A:	Mr. MacNeil's testimony provides two basic rationale for its conclusion:
114		1) "Limiting deferral to QFs of the same type helps ensure reasonable
115		alignment between operating characteristics of a QF and the preferred
116		portfolio resources it is assumed to defer" (MacNeil at lines 239-242);
117		and
118		2) Its example of deferring Wyoming wind resources with a solar resource
119		of equivalent capacity contribution results in anomalous results. (MacNeil
120		at lines 286-301)
121	Q:	Do these rationale reasonably support concluding that avoided costs should
122		be based on similar resources?
123	A.	No. Although I am not a lawyer, these arguments appear to contradict the
124		requirements of PURPA. Although it is correct that renewable resources of
125		different technology types have different characteristics, the regulatory process
126		implementing PURPA has a history of accommodating those differences to the
127		extent practicable. The Utah Commission cited FERC's directives to
128		accommodate such differences in its DOCKET NO. 12-035-100, Order on Phase
129		II Issues, (issued August 16, 2013), pp 5-6.
130		These FERC directives, as well as previous Utah avoided cost dockets, are
131		directed at accommodating the differences that PacifiCorp is now declaring
132		cannot be adequately accommodated. Establishing pricing and procedures for
133		fairly substituting different resource types represents a primary purpose of

134		PURPA's avoided cost requirements. Mr. MacNeil's trouble accounting for
135		differences in resource characteristics overturns considerable precedent and is
136		vastly inadequate support for such an extreme shift in avoided cost methodology.
137	Q:	What is your basis for asserting that PacifiCorp's proposed avoided cost
138		methodology results in avoided cost rates that are not just and reasonable to
139		ratepayers and that discriminate against QF resources?
140	A:	PacifiCorp appears to be claiming that a solar QF's avoided cost pricing can only
141		be based on solar resources in the preferred portfolio that don't come on line until
142		many years into the study horizon, after other new resources are added. If
143		PacifiCorp is seriously claiming that solar has no capacity value ⁴ until new solar
144		resources appear in the preferred portfolio, this argument is technically false,
145		against precedent regarding capacity contributions, contrary to IRP assumptions
146		on capacity contributions, patently discriminatory against renewable resources,
147		and deprives utility ratepayers from the economic (to say nothing of the
148		environmental) benefits of cost-competitive, often local, renewable QFs. This is
149		not a just or reasonable result for ratepayers and is discriminatory against QFs.
150		Furthermore, the solar resources called for in the current IRP do not come on-line
151		until after the expiration of the investment tax credit, further denying ratepayers
152		of the potential benefits of a limited opportunity for extremely cost-effective solar
153		resources.

⁴ (Notwithstanding any capacity value included in displaced front office transactions.)

155 **RECOMMENDATIONS**

Do you have alternative recommendations? 156 **Q**: First of all, PacifiCorp should be clearer in its testimony about how it actually 157 A: proposes calculating avoided costs when a proxy renewable resource is involved. 158 The Commission would be served by a more specific explanation of how the 159 160 Company envisions the Proxy/PDDRR method should be applied when there are multiple types of renewable (and thermal) resources in the preferred portfolio that 161 come in over the IRP study horizon, which may be similar or dissimilar to a 162 163 particular QF. Do you have a proposal for how avoided costs could be calculated, consistent 164 **O**: with FERC regulations and Utah Commission orders, when proxy renewable 165 resources appear in the IRP preferred portfolio? 166 A: Yes. First, any renewable QF resource should receive a capacity payment during 167 168 the deficiency period, consistent with the usual Proxy/PDDRR method of determining avoided capacity value based on the capital and non-fuel fixed and 169 variable operations and maintenance costs of the next deferrable capacity 170 171 (typically thermal) resource from the IRP. For years in which the IRP preferred portfolio calls for renewable 172 resources, the cost of those resources should establish a floor on avoided costs for 173 renewable OFs. This floor should be adjusted as necessary to account for relevant 174 differences between the IRP resource and the QF, such as capacity contribution 175 and integration cost. 176 You can think of this proposal in steps: 177

178		1. Calculate avoided costs using the typical Proxy/PDDRR method, using the
179		next deferrable thermal resource in the IRP to establish a capacity
180		payment during the resource deficiency period.
181		2. Use the IRP preferred portfolio renewable resource cost (levelized
182		cost/MWh) as a floor on avoided costs during the years in the planning
183		horizon in which the renewable resource appears.
184		3. To apply this avoided cost floor to a renewable QF, adjust the floor for
185		relevant differences between the IRP resource and the QF resource, such
186		as capacity contribution and integration cost.
187	Q:	Please explain why preferred portfolio renewable resources should establish
188		a floor for renewable QF avoided costs.
189	A:	QFs displace the utility's highest cost resources. The existence of renewable
190		resources in the preferred portfolio (the least cost, least risk mix of resources) is
191		prima facie evidence that they are at or below the IRP avoided cost, and so should
192		serve as a floor for any calculated avoided cost.
193	Q:	How do you propose to calculate an avoided costs floor for a renewable QF if
194		it is of a different type than a renewable resource called for in the IRP
195		preferred portfolio?
196	A:	The simplest way would be to calculate the levelized energy cost of the IRP
197		resource (the renewable proxy) and then adjust that cost for any differences, such
198		as capacity value and integration cost, between the renewable proxy and the QF.
199		For example, if the Wyoming wind projects in the current preferred portfolio have
200		a levelized energy cost of (say) \$30/MWh, then that should set the floor for

202resources. If another QF wind resource of roughly the same characteristics (e.g.,203capacity value) were to replace the IRP resource, then it stands to reason, that204resource should be worth at least \$30/MWh to the Company. If the QF is a solar205resource, then it should also receive \$30/MWh, plus an adjustment for any206additional capacity value it has, and a further adjustment for any difference in207integration costs.208Q:What effect should the Company's purported ability to defer or not to defer209Wyoming wind projects have?210A:211nodel would choose as much resources because they reduce the Company's212model would choose as much resource with the cost and characteristics of213Wyoming wind as is available, so the deferral of the resource is really irrelevant.214Deferral is much more an issue with respect to the model choosing resources to215maintain its reserve margin, and the ability of QF resources to defer the need to216acquire those resources. For purposes of determining an avoided cost floor based217on a renewable resource proxy, deferral is irrelevant.218	201		renewable QF avoided costs over the years in which the IRP study includes those
 resource should be worth at least \$30/MWh to the Company. If the QF is a solar resource, then it should also receive \$30/MWh, plus an adjustment for any additional capacity value it has, and a further adjustment for any difference in integration costs. Q: What effect should the Company's purported ability to defer or not to defer Wyoming wind projects have? A: None. The model picks renewable resources because they reduce the Company's revenue requirements, not because the model is seeking low cost capacity. The model would choose as much resource with the cost and characteristics of Wyoming wind as is available, so the deferral of the resource is really irrelevant. 	218		

219 CONCLUSION

220 Q: Please summarize your conclusions and recommendations.

- A: The Commission should not accept PacifiCorp's novel and discriminatory
- proposal to limit QF avoided costs to resources of similar technologies as they
- 223 may (or may not) appear in the preferred portfolio. IRP preferred portfolio

- renewable resources can still provide a proxy for the purpose of determining
- renewable QF avoided costs, consistent with my recommendations herein,
- without resorting to the extraordinary and unnecessary restrictions inherent in
- 227 PacifiCorp's proposed methodology.
- 228 Q: Does that conclude your testimony?
- 229 A: Yes.
