As a lifelong citizen of Utah with many family and friends who live here, I demand that you Commissioners reject RMPs energy plan as it focuses on fossil fuel and require that it shift to renewable energy with all haste.

Winter in Utah

We finally convinced my son and wife and two young kids to move back to Utah. They have missed winters they grew up with, and the snowy mountains that promised beauty and water flow into the summer.

We continue to worry about our uncertain, water future, overwhelming proof of global warming, documented worsening warm winters with lack of snow and skiing opportunities.

We understand there's a step backwards from movement towards Solar, geothermal, and wind energy in Utah. More-so, we worry that increasing use of fossil fuels will further speed up this potential climate catastrophe.

Rocky Mountain Power has short-sighted long view, but Utah's PSC can influence and induce a safer broader perspective! Please think big, think long term, imagine the loss of snow and winter activities.

Hey,

Please is my vote wisely and keep RMP accountable for closing coal power plants on time. Air quality in Utah sucks. Ad a concerned resident I will gladly give my vote to someone who will act to make Utah a healthier place long term.

Thanks,

Quinn Everett

Rocky Mountain Power future energy plan

Hello,

Recently I read an article in the Salt Lake Tribune that talked about Rocky Mountain Power's future energy plan.

Allegedly the new plan continues to focus on fossil fuel sources and ignores renewable energy like wind, solar and geothermal.

This past winter snowpack is yet another clue that our climate is changing. It's time for the PSC to do its job and require the monopoly to increase its investment in renewable energy sources that might help save our ski industry and our planet.

Regarding Steven Nyman's letter in the April 23rd Tribune, I couldn't agree more with the jist of the letter with one critical exception. Nyman wrote "This isn't just about energy policy, it's about whether future generations get to experience Utah the way we have." I say, forget about whether future generations get to experience Utah winters! What we need to be concerned about is whether or not future generations will get to experience a planet that is habitable.
