

**REDACTED**

Rocky Mountain Power

Docket No. 26-035-05

Witness: Thomas R. Burns

BEFORE THE PUBLIC SERVICE COMMISSION  
OF THE STATE OF UTAH

ROCKY MOUNTAIN POWER

---

**REDACTED**

Direct Testimony of Thomas R. Burns

February 2026

1           **I.       INTRODUCTION OF WITNESS AND QUALIFICATIONS**

2   **Q.    Please state your name, business address, and present position with PacifiCorp**  
3       **d/b/a Rocky Mountain Power (“Rocky Mountain Power” or the “Company”).**

4   A.   My name is Thomas R. Burns. My business address is 825 NE Multnomah Street, Suite  
5       600, Portland, Oregon 97232. I am currently employed as Vice President of Resource  
6       Planning and Acquisitions for PacifiCorp.

7   **Q.    Please describe your education and business experience.**

8   A.   I graduated from Illinois State University with a Bachelor of Science degree in  
9       Economics. I joined PacifiCorp in 2007 and assumed the responsibilities of my current  
10      position in September 2022. Over the course of my employment with PacifiCorp, I  
11      have held several operational, analytical, and leadership positions. My previous role  
12      was Director of Energy Supply Management, Operations, and Reliability, where I was  
13      instrumental in the design and implementation of the Western Energy Imbalance  
14      Market, a real-time energy market that automatically dispatches low-cost energy  
15      resources to generate cost savings for participating utilities and their customers.

16 **Q.    Briefly describe the responsibilities of your current position.**

17 A.   I am responsible for PacifiCorp’s resource planning and procurement functions,  
18      including the Integrated Resource Plan (“IRP”), structured commercial business and  
19      valuation activities, and long-term load forecasts. Most relevant to this proceeding, I  
20      oversee the planning, analysis, and outreach processes used to develop PacifiCorp’s  
21      IRP and the economic analysis that guides PacifiCorp’s resource acquisitions.

22 **Q.    Have you provided testimony in previous regulatory proceedings?**

23 A.   Yes. I have provided testimony in previous regulatory proceedings before the Public

24 Service Commission of Utah (“Commission”), the California Public Utilities  
25 Commission, the Idaho Public Utilities Commission, the Oregon Public Utility  
26 Commission, the Washington Utilities and Transportation Commission, and the  
27 Wyoming Public Service Commission.

28 **II. PURPOSE OF TESTIMONY**

29 **Q. What is the purpose of your testimony in this proceeding?**

30 A. I provide economic analysis supporting Rocky Mountain Power’s decision to enter into  
31 a new Large Load Service Contract (“Proposed LLSC”) between Rocky Mountain  
32 Power and [REDACTED] (“Customer”). My testimony provides  
33 evidence that the Proposed LLSC meets the relevant statutory and administrative  
34 requirements for large load contracts as described in Utah Code sections 54-26-101  
35 through 54-26-901 (the “Large Load Act”) and Utah Administrative Rules R746-318,  
36 Large Scale Electric Requirements, effective January 1, 2026 (the “Large Load  
37 Rules”), and how approval of the Proposed LLSC is reasonable and in the public  
38 interest.

39 **Q. Please provide an overview of your testimony.**

40 A. The economic analysis that is the basis of my testimony demonstrates that the large  
41 load customer will bear all large load incremental costs attributable to receiving the  
42 requested electric service, and existing ratepayers will not bear costs that are justly and  
43 reasonably attributable to the Company’s provision of that service. To achieve this  
44 result, the Company has structured the Proposed LLSC in a manner that ensures the  
45 large load customer pays for the market energy costs attributable to its receipt of the  
46 requested service while also collecting charges from the Customer that are adequate to

47 recover the Company's costs of providing that service, as described in Company  
48 witness Mr. Craig M. Eller's direct testimony. To confirm that the structure of the  
49 Proposed LLSC accomplishes this result, I undertook an analysis of the Company's  
50 resource portfolio, factoring in the proposed load service, the additional market  
51 purchases, and the "Proposed Resources" described in Mr. Eller's testimony to ensure  
52 that the Company's system remains reliable during the term of the Proposed LLSC.  
53 This analysis was accomplished using the PLEXOS optimization tool, the  
54 comprehensive simulation tool used by the Company to develop and evaluate resource  
55 portfolios in the IRP process. The new load of the Customer and the Proposed  
56 Resources were added to the 2025 IRP preferred portfolio to ensure the net addition  
57 was sufficient to maintain reliable operations. The result of my analysis determined  
58 that serving the Customer load with the Proposed Resources yields a resource portfolio  
59 that is as reliable as the 2025 IRP preferred portfolio, and that there will be no cost  
60 shifting to existing retail customers.

### 61 III. ECONOMIC ANALYSIS AND SYSTEM MODELING

62 **Q. What additional resources were identified as necessary to reliably provide service**  
63 **under the Proposed LLSC?**

64 A. Using its industry best practices and knowledge of the PacifiCorp system for resource  
65 planning and use of industry-accepted capacity accreditation programs, the Company  
66 determined that the Proposed Resources provide sufficient capacity to provide service  
67 to the Customer while maintaining overall system reliability. This capacity was later  
68 confirmed to yield a reliable portfolio in PLEXOS model runs, as I describe later in my  
69 testimony.

70 **Q. Why were the Proposed Resources viewed as likely to be sufficient to reliably serve**  
71 **the new Customer load?**

72 A. The PacifiCorp East (PACE) Control Area has an abundance of generation resources  
73 that are often dispatched lower than they could otherwise generate due to the abundance  
74 of zero fuel cost energy, including variable energy resources such as wind, solar and  
75 economic market transfers and fluctuations in customer energy usage. However, during  
76 certain periods of the year, particularly in summer months, it can be challenging to have  
77 sufficient capacity [REDACTED] to shift available energy into peak customer  
78 usage periods.

79 **Q. Please summarize the modeling tools and methodology the Company used in its**  
80 **system analysis of the Proposed LLSC.**

81 A. The analysis is based on simulations conducted using the PLEXOS modeling tool,  
82 which was used to evaluate system conditions for the term of the Proposed LLSC. The  
83 analysis was based upon the preferred portfolio identified in the Company's 2025 IRP  
84 released on March 31, 2025, with production tax credits and investment tax credits  
85 included consistent with then-current law prior to the passage of the One Big Beautiful  
86 Bill Act (H.R. 1) in July 2025. PLEXOS is the same production cost model the  
87 Company uses to produce its IRP and to evaluate bids received in response to requests  
88 for proposals or that may be offered bilaterally by a developer.

89 The Company used the 2025 IRP preferred portfolio and load forecast as the  
90 base case and added the Proposed Resources. The Proposed Resources optimally  
91 dispatch in the model based on the model's forecasted locational marginal prices  
92 ("LMPs"). The demand forecast for Customer was grossed up for system losses and

93 added to the gross system demand. The model was allowed to run and optimize the  
94 system using economic market purchases, the economic dispatch of the Proposed  
95 Resources, and the economic dispatch of generation in the preferred portfolio in  
96 response to the increased load.

97 **Q. How did the model address Customer costs in the economic analysis?**

98 A. The modeling included the fact that Customer will pay, through the Reservation Charge  
99 described in Mr. Eller's direct testimony, all costs associated with the Proposed  
100 Resources, as well as other costs related to providing service. System generation  
101 resources will have increased dispatch costs as they are more frequently dispatched,  
102 and at higher marginal costs, to meet the increased need for energy with the additional  
103 Customer load. These increased dispatch costs will be reimbursed by Customer through  
104 the Energy Charge [REDACTED]  
105 [REDACTED]  
106 [REDACTED]. The direct testimony of Company witness Mr. Ramon J. Mitchell  
107 provides details about how the accounting related to Customer demand will be resolved  
108 [REDACTED], which will ensure that Customer pays all of the  
109 marginal costs of providing its requested load service.

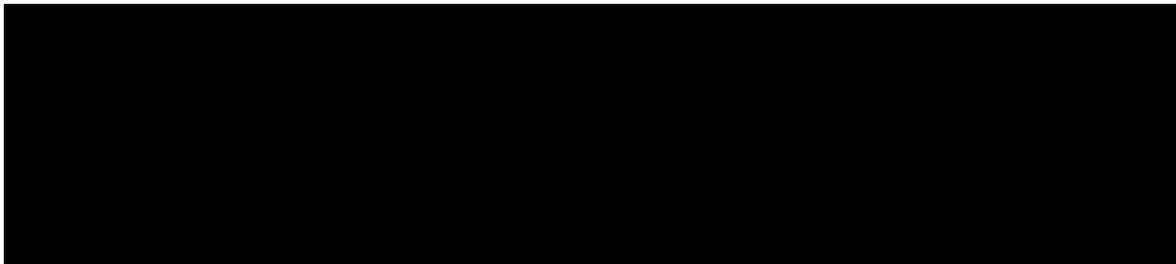

110 **Q. Does the addition of the large load increase costs for the existing system?**

111 A. No. Although the PLEXOS modeling demonstrates that aggregate gross system costs  
112 do increase to serve the increased demand from Customer, the payment from Customer  
113 for their increase in energy at [REDACTED] results in a net benefit to existing customers  
114 from the optimal dispatch of system generation resources and the addition of the  
115 Proposed Resources.

116 **Q. What is the estimated system benefit of the Company serving Customer in**  
117 **accordance with the Proposed LLSC with the addition of the Proposed**  
118 **Resources?**

119 A. The total benefit for the system is [REDACTED] in nominal dollars under normal  
120 weather conditions during the term of the agreement. This is calculated as the  
121 difference between the cost paid by Customer at [REDACTED]  
122 [REDACTED] less the increase in system costs associated with the 2025 IRP preferred portfolio  
123 resources. Table 1 below shows the calculation of the net benefit to existing customers  
124 identified by the PLEXOS model.

125 **Table 1: System and Contract Costs and Resource Benefits**

A large black rectangular redaction box covers the content of Table 1, which would typically contain numerical data and descriptions of system and contract costs and resource benefits.

126 **Q. How does the increased demand from the new Customer load impact current**  
127 **generation resources?**

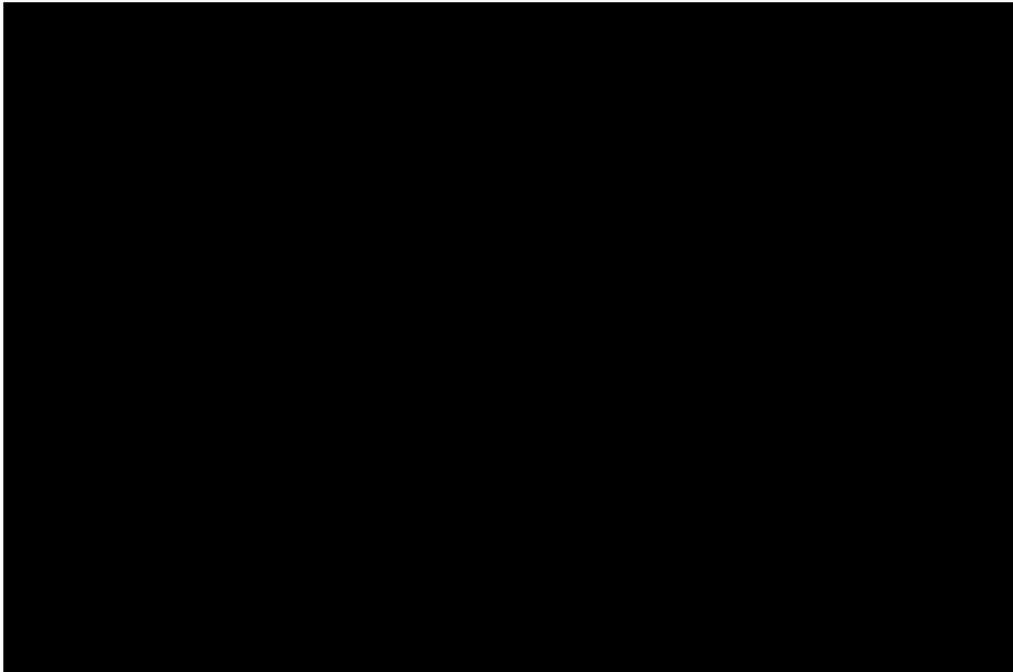

128 A. Generating resources included in the 2025 IRP preferred portfolio are estimated to  
129 increase output by over [REDACTED] to support the Proposed LLSC. As shown in  
130 Table 2, this includes an increase of [REDACTED] of gas-fired generation,  
131 [REDACTED] of coal-fired generation, and a [REDACTED] reduction of  
132 curtailment of renewable wind and solar resources. Additionally, the modeling  
133 indicates a [REDACTED] increase in market purchases and, therefore, that other  
134 resources not owned or contracted by the Company will also see higher utilization, as  
135 would be expected. It is important to note that available economic market transfers

136 were reduced to zero during periods of peak forecast system demand. This was done to  
137 ensure that reliable load service to the customer was not dependent upon market  
138 purchases.

139 **Q. Did the Company take any steps to further check the impact of Customer load on**  
140 **existing generation resources?**

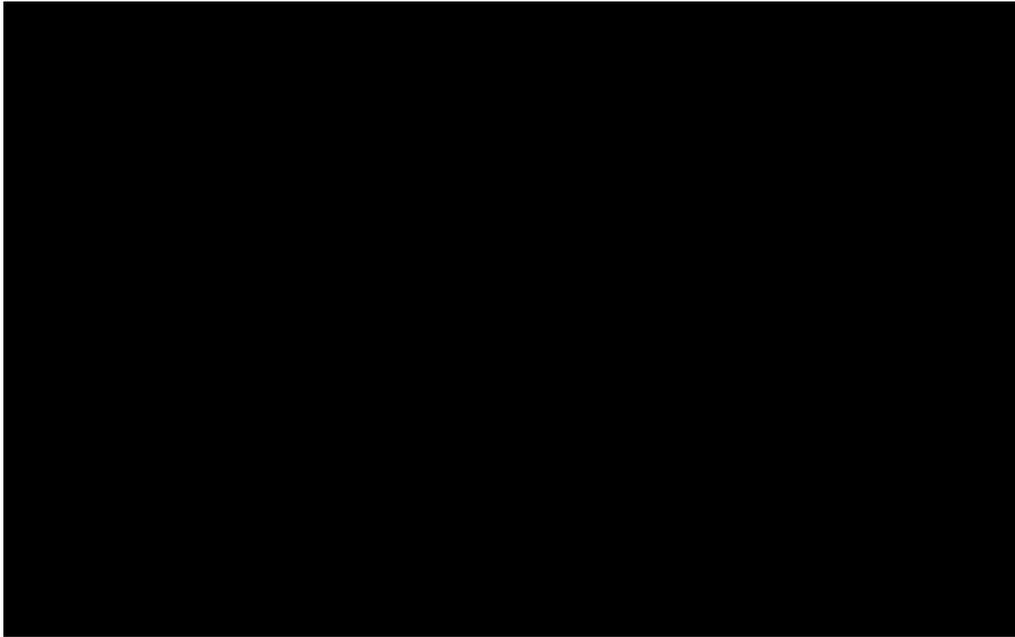

141 A. Yes, as an additional check, the Company re-dispatched both the 2025 IRP preferred  
142 portfolio and the portfolio including the new Customer load and the Proposed  
143 Resources in PLEXOS while not allowing the model to select market purchases in any  
144 hours. Table 3 shows the increase in system generation when market purchases were  
145 unavailable.

146 **Table 2: Increase/(Decrease) in Generation (MWh) by Resource Type to Serve**  
147 **Load – Market Purchases Allowed**

148  
149

**Table 3: Increase/(Decrease) in Generation (MWh) by Resource Type to Serve Load – No Market Purchases**

150 **Q. Does providing service under the Proposed LLSC negatively impact reliability?**

151 A. No. The model results indicate that there was no material change in energy not served  
152 (“ENS”) under normal conditions as compared to the 2025 preferred portfolio. A  
153 variant scenario was run that eliminated market purchases, and that resulted in a small  
154 increase of [REDACTED] of unserved energy over the life of the contract. This is  
155 equivalent to approximately three total hours of curtailment for the customer load over  
156 the life of the contract, which is not a material amount. The year 2013 was the most  
157 challenging stochastic year for the 2025 IRP preferred portfolio. When the stochastic  
158 year 2013 was applied to the entire life of the Proposed LLSC and was modeled with  
159 the Proposed Resources, an additional ENS of [REDACTED] over the life of the contract  
160 was identified. This is equivalent to approximately two hours of curtailment of the  
161 customer load over the life of the Proposed LLSC, which is not a material change from  
162 the 2025 IRP preferred portfolio.

163

**Table 4: Energy Not Served (“ENS”) in MWh**

164

**IV. CONCLUSION**

165 **Q. Please summarize the conclusions of your testimony.**

166 A. The PLEXOS economic and reliability analysis shows that the decision to enter the  
167 Proposed LLSC is prudent and will not cause harm to its retail customers.

168 **Q. What is your recommendation to the Commission?**

169 A. I recommend that the Commission determine that the Company’s decision to enter into  
170 the Proposed LLSC is prudent, in the best interest of Rocky Mountain Power’s retail  
171 customers, and is compliant with the requirements laid out in the Large Load Act.

172 **Q. Does this conclude your direct testimony?**

173 A. Yes.
