We've seen the cost at the pump for gasoline go down, and continue to slide by double digits-30% plus. The price at the CNG pumps has held at 1.70 I understand the desire to artificially flatten the price volatility, and continue ease price upward. Doesn't it make sense to adjust commodities more a little more frequently?

To push consumers into alternative fuels to lower environmental impact may require pricing models that dip below the 75% threshold. Where there were lines at the CNG pumps 4 years ago, sadly the stations are now equipped for volume and are ghost towns... It's about the price at the pump.
