VIII. CONCLUSION.....29

1                                   **I. IDENTIFICATION OF WITNESS**

2   **Q. PLEASE STATE YOUR NAME, EMPLOYER, AND BUSINESS ADDRESS.**

3   A. My name is Casey J. Coleman. I am employed by the Division of Public  
4   Utilities (“Division”) for the State of Utah. My business address is 160 East  
5   300 South Salt Lake City, UT 84114.

6   **Q. HAVE YOU PREVIOUSLY FILED DIRECT TESTIMONY IN THIS**  
7   **MATTER?**

8   A. Yes.

9   **Q. DESCRIBE THE PURPOSE OF YOUR TESTIMONY.**

10   A. The purpose of my testimony is to address a variety of issues discussed in  
11   rebuttal testimonies provided by the Office of Consumer Services (“OCS”) and  
12   Carbon/Emery Telecom, Inc. (“Carbon”). In the rebuttal testimony of Mr.  
13   David Brevitz, OCS and Mr. Douglas Duncan Meredith, Carbon, they argue  
14   why the proposed methodology and inputs calculated by the Division of Public  
15   Utilities (“DPU”) should be modified or rejected. My Surrebuttal testimony  
16   will clarify the inputs used by the DPU and why the Public Service  
17   Commission of Utah (“Commission”) should accept the DPU’s  
18   recommendations.

19

**II. INTERSTATE RATE OF RETURN**

20 **Q. ARE THERE ANY CHANGES OR MODIFICATIONS YOU WOULD LIKE**  
21 **TO MAKE REGARDING YOUR PREFILED DIRECT TESTIMONY?**

22 A. Yes.

23 **Q. WHAT MODIFICATION ARE YOU MAKING TO YOUR PREFILED**  
24 **TESTIMONY?**

25 A. At line 119 of my direct testimony I state the “correct interstate rate to use  
26 when calculating the allowed rate of return is 9.40%, which blends the  
27 Common Line, Switched Traffic Sensitive and Special Access pools.” After  
28 further research, discussions with Carbon, and employees at National  
29 Exchange Carrier Association, Inc. (“NECA”) the Division has learned the  
30 correct interstate rate earned by Carbon is the 11.45%.

31 **Q. WILL YOU EXPLAIN WHY THE DIVISION IS RECOMMENDING**  
32 **USING THE INTERSTATE RATE OF 11.45 PERCENT?**

33 A. Yes. The original recommendation in my direct testimony was based on a  
34 faulty understanding that Emery Telecom, Carbon, and Hanksville  
35 Telecommunications participated in the NECA pools as separate entities and  
36 therefore would have the potential for different interstate rates. However,  
37 Mr. Woolsey has since explained that NECA treats all three companies as  
38 one “entity” and the rates are for a study area not for one specific company.

39           Additionally, as the National Exchange Carrier Association, Inc.'s Tariff  
40           F.C.C. 5, which I have included as Exhibit DPU SR 3.2, shows, the only entity  
41           NECA has record information for is Emery Telephone Company d/b/a Emery  
42           Telecom.

43           My earlier recommendation of using an interstate rate of 9.40% for Carbon  
44           was based on the belief that Emery Telecom was the only company in Utah  
45           that was not participating in all three of the NECA pools, i.e. Interstate,  
46           Common Line and Special Access. Because my belief that Emery Telecom  
47           was the only Common Line pool company and therefore the only company  
48           that should use an applicable interstate rate from the first form 492A. This  
49           misguided premise led to the faulty recommendation of using an interstate  
50           rate of 9.40% for Carbon.

51   **Q.    CAN YOU EXPLAIN A BIT MORE WHY IT MATTERS IF A COMPANY**  
52   **IS PARTICIPATING IN ALL THE NECA POOLS OR JUST COMMON**  
53   **LINE?**

54   **A.**    Yes. The importance of this point lies in the fact that NECA produces two  
55           492A forms. One form has the information for companies that are exclusively  
56           participating in Common Line only. The first form 492A shows an interstate  
57           rate of return for those companies of 11.45%. The second form 492A shows  
58           an interstate rate of return for NECA companies that are participating in

59 Common Line, Special Access, and Interstate rate pools. The reality is that  
60 because NECA allows companies to choose which pools they want to  
61 participate in and receive the applicable cost recovery, there are two different  
62 forms, but only **ONE** form is applicable to a certain study area. For Carbon  
63 the appropriate form 492A that shows the earned interstate rate is the  
64 Common Line form or the first form in OCS Exhibit 2D-2. If every company  
65 that is part of NECA participated in Common Line only, then there would  
66 only be one form, the form 492A that states the rate of return of 11.45%.  
67 There would be no “blending of the rates” because all the companies would  
68 be earning 11.45%. Conversely, if all companies participated in all three  
69 pools, there would only be the second form 492A which shows the blending of  
70 the rate and the 9.40% for interstate.

71 **Q. WILL YOU DISCUSS HOW FORM 492A IS APPLICABLE TO UTAH**  
72 **ADMIN. CODE § R746-360-8 (A) (1)?**

73 A. Yes. For ease of discussion I have included Utah Admin. Code § R746-360-8  
74 (A) (1) below:

75 **R746-360-8. Calculation of Fund Distributions in Rate-of-Return**  
76 **Incumbent Telephone Corporation Territories.**

77 (A) Determination of Support Amounts --

78 (1) Incumbent telephone corporation - Monies from the fund will equal the numerical  
79 difference between the Incumbent telephone corporation's total embedded costs of  
80 providing public telecommunications services, for a designated support area, less the  
81 product of the Incumbent telephone corporation's Average Revenue Per Line, for the

82 designated support area, times the Incumbent telephone corporation's active access lines in  
83 the designated support area. To the extent the Commission finds that inclusion of any cost  
84 will result in an inefficient use of USF funds or in a use of USF funds that is inconsistent  
85 with the public interest, such cost will be excluded from total embedded costs. Total  
86 embedded costs shall include a weighted average rate of return on capital of the intrastate  
87 and interstate jurisdictions. For example, in the case of an Incumbent telephone corporation  
88 whose costs are allocated fifty percent to each jurisdiction and whose interstate return is  
89 11.25 percent and whose intrastate return authorized by the Commission is 9 percent, the  
90 weighted average return on capital would be 10.125 percent.

91 (a) In order to determine the interstate return on capital to calculate the weighted average  
92 rate of return on capital for Incumbent telephone corporations, the Commission shall:

93 (i) use the prior year return reported by the National Exchange Carriers Association (NECA)  
94 to the Federal Communications Commission (FCC) on FCC Form 492 for Incumbent  
95 telephone corporations that do separations between intrastate and interstate jurisdictions  
96 under 47 CFR Part 36. In the event that the Incumbent local telephone corporation uses a  
97 future test period as provided in Utah Code Ann. Subsection 54-4-4(3)(b)(i), the interstate  
98 return for these Incumbent telephone corporations shall be the average of the actual return  
99 for the prior three years as reported on FCC Form 492.

100 As the above rule states, parties who want to determine the interstate rate  
101 of return on capital must use NECA Form 492. It would seem that the rule's  
102 intent is to use the rate of return that is earned by the Incumbent telephone  
103 corporations, i.e. Carbon, in the NECA pools and not some blended rate that  
104 does not apply to that specific company.

105 **Q. IS THERE ANOTHER WAY TO VERIFY THAT CARBON IS**  
106 **PARTICIPATING EXCLUSIVELY IN THE COMMON LINE POOLS?**

107 A. Yes. . If you look at the NECA Tariff F.C.C No. 5, which I included as Exhibit  
108 DPU SR 3.2, a quick analysis of this rate table lists a variety of different  
109 columns labeled State, Study Area Number, MLB EUCL, SPA, ETS, LS, LT,  
110 and TST. Other than State and Study Area, the remaining columns are

111 showing the applicable rate bands for each NECA pool participant.  
112 Searching specifically for Emery Telecom you can see the company specific  
113 information listing the number 15 under MLB EUCL, and the remaining  
114 columns show N/A. As this tariff shows, Emery and all the companies in the  
115 same Study Area are only participating in the Common Line Pools. This  
116 tariff shows that the applicable form 492A to use for Carbon is the one that  
117 has only Common Line elements and not a blending of all the pools. Carbon  
118 participates only in the Common Line Pool.

119 **Q. DO YOU AGREE WITH MR. BREVITZ'S INTREPRETATION OF**  
120 **COMMISSION RULE R746-360-8?**

121 A. No. Mr. Brevitz makes a detailed argument how the interstate rate of return  
122 must be a blended rate. The Division agrees that there is a weighted  
123 calculation that must happen to determine the appropriate cost recovery for  
124 Carbon, but the weighting the rule suggests is with the interstate and  
125 intrastate rate according to specific company separations between interstate  
126 and intrastate. The rule does not require the interstate rate to be "blended"  
127 or a weighted average between Special Access, Common Line, and Interstate.  
128 Instead it seems like the rule contemplates one "data point" from the form  
129 492A that will be used for the interstate rate. Mr. Brevitz and I will disagree  
130 about which form should be used and as a result which interstate rate is  
131 appropriate, but I believe the Commission rule clearly requires the interstate

132 rate is the rate “earned” by the company. Carbon has earned 11.45% on their  
133 interstate Common Line assets; therefore, that earned rate must be used  
134 according to rule.

135 **Q. IN LINES 84-93 IN MR. BREVITZ’S REBUTTAL TESTIMONY HE**  
136 **DISCUSSES AN INCONSISTENCY IN USING THE COMMON LINE**  
137 **ONLY INTERSTATE RATE. DO YOU AGREE USING THIS RATE**  
138 **COULD CREATE AN INCONSISTENCY?**

139 A. Yes. While the intent of the Commission’s rule seems clear to use the  
140 interstate rate from 492A there is a potential pitfall. As Mr. Brevitz argued  
141 in his testimony, Carbon has special and switched access in addition to  
142 common line services. Because Carbon earns a rate of return only on its  
143 Common Line from NECA there is no way to determine what the “earned”  
144 rate of return is for Carbon on their special and switched access services.  
145 This creates a situation where the bulk of the interstate earned rate is  
146 unknown. If the intent of the Commission rule is to allow Carbon to get cost  
147 recovery on its interstate facilities at the rate that is “earned”, allowing  
148 Carbon to earn the 11.45% on all their interstate assets creates an  
149 inconsistency. As with any unknown it is certainly possible that Carbon is  
150 earning higher than 11.45%, but it is also just as likely and more realistic  
151 that Carbon is earning less than the 11.45%. If Carbon is earning less than  
152 the 11.45% on switched and special access services there is an arbitrage

153 possibility that would cause the State USF to provide revenues at an allowed  
154 a rate of return that is higher than what Carbon is earning.

155 **Q. HOW WOULD YOU SUGGEST THE COMMISSION DEAL WITH THIS**  
156 **INCONSISTENCY?**

157 A. I don't believe the rule allows for the Commission to use anything other than  
158 the interstate rate on form 492A, but if the Commission wanted to adjust for  
159 this potential arbitrage situation there are a couple of viable options. The  
160 first would be to have the rural phone companies provide the actual "earned"  
161 return on their special and switched access. The calculated rates could be  
162 used to develop a weighted average interstate rate. The other option the  
163 Commission could consider would be to calculate what portion of the  
164 interstate rate base is specific to common line. That portion of the interstate  
165 rate base could be calculated at the rate given on form 492A from NECA. The  
166 remaining rate base would receive the cost of equity that is applicable to  
167 intrastate rates. For illustrative purposes, let's assume a company had  
168 allocated 55 percent to intrastate and 45 percent to interstate. When  
169 breaking out the portion of the interstate allocation, 72 percent is Common  
170 Line and the remaining 28 percent is to switched and special access. To  
171 adjust for the potential gap discussed above the Commission would use a  
172 factor of .324 for the interstate portion. ( $.72 * .45$ ). The remaining rate base  
173 would be assessed at the .676 factor. This would lower the interstate portion

174 to more accurately reflect a lower rate of return that companies are earning  
175 on special and switched access.

176 **III. CAPITAL ASSET PRICING MODEL**

177 **Q. DO YOU BELIEVE THE DPU FOLLOWED THE CORRECT**  
178 **METHODOLOGY TO DETERMINE THE COST OF CAPITAL FOR**  
179 **CARBON?**

180 A. Yes.

181 **Q. BY USING THE CAPM AND HYPOTHETICAL CAPITAL**  
182 **STRUCTURE THE DIVISION HAS CALCULATED A FAIR AND**  
183 **REASONABLE RATE?**

184 A. Yes. In Docket No. 08-046-01 the Commission had many of the similar issues  
185 and arguments as are being argued here. In reviewing the details of Manti  
186 Telecom and Carbon I find nothing vastly different between those two  
187 companies that would warrant using a different methodology in this case. In  
188 the confidential report and order issued by the Commission on December 28,  
189 2012 on page 21 the Commission states as follows:

190 “Considering the evidence presented regarding a reasonable return on  
191 equity, i.e., the Division’s use of the capital asset pricing model, the  
192 Commission is persuaded the Division’s analysis produces a fair and

193 reasonable result. We [the Commission} therefore approve the Division's  
194 recommended rate of return on equity."<sup>1</sup>

195 Because the Commission has already found that the Division's method  
196 produces fair and reasonable results, the Division believes using a CAPM  
197 model and hypothetical capital structure in this case would produce the  
198 similar results; fair and reasonable results.

199 The Commission should reject Mr. Meredith suggestion to reject the CAPM  
200 unless there are adjustments to the textbook approach of calculating the cost  
201 of equity. The Commission has spoken quite clearly that a textbook approach  
202 to calculating CAPM without modifications for size, liquidity, and leveraged  
203 betas produces fair and reasonable results.

204 The issues Mr. Meredith discusses are the same issues the Commission  
205 considered in the Manti case. Because all of those issues were recently  
206 considered the Commission should not re-evaluate its recent decisions  
207 without evidence that Carbon is vastly different than Manti or markets are  
208 vastly different than they were then.

---

<sup>1</sup> Even though this docket was confidential, the Division does not believe the above statement by the Commission is confidential. As a result we included the statement in the public version of the testimony.

209 **Q. MR MEREDITH USES YOUR ENDORSEMENT OF CAPM AS BEING**  
210 **LUKEWARM AS SOME JUSTIFICATION FOR MODIFYING THE**  
211 **CAPM CALCULATION. WILL YOU EXPLAIN YOUR REASONING**  
212 **FOR BEING LUKEWARM ABOUT CAPM?**

213 A. Yes. As Mr. Meredith explained in his rebuttal testimony there are some  
214 potential pitfalls in using a text book or simple CAPM. I agree that there are  
215 some challenges with using CAPM. But as I discussed before in my direct  
216 testimony, with a small rural phone company it is virtually impossible to use  
217 any other method, such as a modified discounted cash flow, comparable  
218 companies, etc. There is almost no publicly available information to  
219 determine a rate of return that produces reasonable results. This stark fact  
220 is one germane element of my reluctance to enthusiastically recommend the  
221 CAPM method.

222 Despite the difficulties and challenges in using CAPM as discussed above  
223 there are more basic and significant reasons my comfort level in using a  
224 CAPM is only lukewarm. My biggest concern and lack of full endorsement for  
225 the model is the fact that the model is based on portfolio theory instead of  
226 one single stock.

227 A multitude of assumptions are required to obtain the CAPM. Two general  
228 assumptions overshadow the others. The first general assumption is that  
229 capital markets are competitive and efficient, with information freely

230 available to all investors and rapidly impounded in security prices such that  
231 security prices can be trusted to represent the best estimate of the true value  
232 of a security at a point in time. The second general assumption is that  
233 investors are rational profit-maximizers who pursue their monetary self-  
234 interests, demanding higher returns for higher risks and driving expected  
235 returns toward their levels predicted by the security mark line.

236 The remaining assumptions are more stringent and specialized.

237 1) Investors hold diversified portfolios and operate in capital markets  
238 unencumbered by transaction costs, taxes, and restrictions on borrowing  
239 and short-selling.

240 2) Investors possess homogeneous expectations, thereby agreeing on the  
241 likely prospects of securities over a common time horizon.

242 3) Investors preferences and the statistical nature of the security returns  
243 follow rigid definite patterns.

244 Additionally, the CAPM model depends on company-specific risk and market  
245 risk. Company-specific risk is that part of a security's risk associated with  
246 random events; it can be eliminated by proper diversification. Lawsuits,  
247 strikes, successful and unsuccessful marketing programs, and the winning  
248 or losing of major contracts are unique events to a particular firm that would

249 be classified as company specific risks. Market risk on the other hand, stems  
250 from factors that systemically affect most firms such as war, inflation,  
251 recessions, and high interest rates. Since most stocks will tend to be  
252 negatively affected by these factors, market risk cannot be eliminated by  
253 diversification. The fact that a large part of the riskiness of any individual  
254 stock can be eliminated is vitally important in portfolio theory

255 Because we know that investors demand a premium for bearing risk, that is,  
256 the higher the riskiness of a security, the higher the expected return required  
257 to induce investors to buy (or to hold) it, the CAPM model tries to quantify  
258 that individual risk. Essentially, the CAPM model is trying to quantify the  
259 riskiness of an individual stock when investors are concerned with portfolio  
260 theory and assign a number that can be calculated to represent that risk.  
261 That calculated return signifies how this one individual stock's expected  
262 return will vary compared to all other stocks in a portfolio.

263 The core idea of CAPM is that investors can eliminate company-unique risks  
264 by appropriate diversification, and therefore should not be rewarded for  
265 bearing this superfluous risk. Diversified risk-averse investors are only  
266 exposed to market risk, and are therefore rewarded with higher expected  
267 returns for bearing only market-related risk. Beta is a measure of market

268 risk, and captures the extent to which a security's returns move in tandem  
269 with the returns of the overall risk.

270 Risk-averse investors demand higher returns for assuming additional risk,  
271 and high-risk securities are priced to yield higher than expected returns than  
272 lower risk securities. The CAPM quantifies the additional return required  
273 for bearing incremental risk, and provides a formal risk-return relationship  
274 anchored on the basic idea that only market risk matters, to portfolio  
275 investors, as measured by beta.

276 **Q. SO WHY DOES USING A PORTFOLIO THEORY FOR CALCULATING**  
277 **A COST OF EQUITY FEEL LIKE FITTING A SQUARE PEG IN A**  
278 **ROUND HOLE WHEN LOOKING AT SMALL RURAL PHONE**  
279 **COMPANIES IN UTAH?**

280 A. I am less than absolute in my support for CAPM because it uses a method  
281 that goes contrary to regulatory rate setting and the "risks" the cost of capital  
282 is trying to compensate for investors. Generally, the Commission is trying to  
283 set rates that are fair and reasonable that will allow investors to be  
284 compensated for the risk of investing in the regulated utility while allowing  
285 the regulated utility enough capital to invest in the necessary infrastructure.  
286 The Commission must determine if the capital expenditures are prudent, just  
287 and reasonable. Unfortunately, many of the financial models are developed  
288 with the premise of allowing investors a method to determine the level of risk

289 between one type of investment or another investment. Most of the financial  
290 models were not designed to evaluate a small rural phone company whose  
291 stocks are privately held and has a government fund to offset many of the  
292 financial and business risks encountered in the market.

293 Because CAPM is trying to evaluate how an individual stock will vary in  
294 certain market conditions according to a portfolio of stocks, it does not get to  
295 the nuts and bolts that really make up a small rural phone company. Because  
296 the CAPM does not really reflect the realities of doing business as a small  
297 rural phone company, it feels like the results are almost stretched to fit the  
298 circumstances. As I will discuss in further detail, as you keep adjusting the  
299 basic theory, the results keep getting stretched and twisted until it is difficult  
300 to say that the calculated rate reasonably reflects the situation of the  
301 company. To avoid this stretching, the Commission should not use the  
302 various “tools” of a liquidity premium, a small company premium,  
303 normalization of rates because of abnormal treasury rates or any other tool  
304 to modify CAPM. Such adjustments do not capture the specific realities of  
305 Carbon or small rural phone companies.

306

#### IV. ADJUSTMENTS TO CAPM

307 **Q. WHY DO YOU THINK THAT ADJUSTMENTS TO CAPM ARE**  
308 **UNNECESSARY?**

309 A. In financial theory, small company premiums, adjusting for liquidity, and  
310 other of the tools suggested make sense to consider on a macro level. No one  
311 would argue that a large multi-national corporation like AT&T or Verizon  
312 would have a harder time attracting capital than a small flower shop in  
313 Price, Utah. Additionally, because AT&T or Verizon is traded daily on the  
314 various stock exchanges, their stocks are more liquid than Alaska  
315 Communications.

316 The challenge with the financial models is that the assumptions are for  
317 publicly traded companies who are dealing with the same market factors and  
318 constraints. The premise in investing is that the relationship between risk  
319 and return is such that no investment will be made unless the expected rate  
320 of return is high enough to compensate the investor for the perceived risk of  
321 the investment. Investment risk, is related to the probability of actually  
322 earning less than the expected return—the greater the chance of low or  
323 negative returns, the riskier the investment. To compensate for that “higher  
324 risk” there is a risk premium to investors, which is the difference between the  
325 expected rate of return on a given risky asset and that on a less risky asset.

326 In lines 342 – 344 of Mr. Meredith’s rebuttal testimony he shows a graph that  
327 illustrates some of the risks that are being evaluated in financial theory that  
328 is trying to capture the correct “risk premium” for a given risky asset. Under  
329 small stocks it shows a small-stock premium, equity risk premium, bond  
330 horizon premium, real riskless rate, and inflation. While these are generally  
331 accepted adjustments in theory for most publicly traded stocks, the Division  
332 does not believe that they are applicable to Carbon. When a company is  
333 subsidized by a government fund, it is incorrect to say that it as “risky” of an  
334 investment as a publicly traded company that does not have the same safety  
335 net. As a general statement utilities are considered a lower risk investment  
336 than most industries. Because the cash flows of a small rural Utah phone  
337 company are fairly static because of subsidization, the risk of that security is  
338 even lower than traditional utilities. Because Carbon receives money from  
339 USFs its risk is much different from traditional “small companies”. Because  
340 of this decreased risk, there is no need to adjust the CAPM.

341 Mr. Meredith argues otherwise in his rebuttal testimony in lines 217 – 222.  
342 He states “[t]raditional methods of calculating a rate of equity for small  
343 companies has a tendency to understate the lack of access to equity markets  
344 and the corresponding return that is necessary to attract equity to remote  
345 locations in Utah.” Mr. Meredith implies that using all the various financial

346 “tools” is necessary to ensure the cost of capital is adequate to attract capital  
347 and fairly compensate investors for the opportunity cost that is the basic  
348 principle of investing.

349 The Division disagrees because Carbon does not resemble such small  
350 companies in either risk or access to capital. Because the financial theories  
351 Mr. Meredith discusses deal with publicly traded companies who are  
352 generally exposed to the same market risks and challenges, a CAPM, or  
353 various cash flow models, or even comparable companies applies to such  
354 companies. The reality is that a small rural phone company that has access  
355 to capital has some inherent advantages not available to companies of the  
356 type the model assumes. These advantages make the companies less risky  
357 when looking at investment risk. This requires a lower return than a much  
358 more speculative and risky investment. As will be detailed later in my  
359 testimony, Carbon has some inherent advantages because of a State USF  
360 which lowers the cost of equity and the risks for small companies that are  
361 inherent in assumptions of financial models. Because of this fact the Division  
362 believes the CAPM model most likely overstates the appropriate cost of  
363 equity for rural phone companies. To adjust the rates for small companies,  
364 as suggested in financial theory, would be exacerbating the overstated cost  
365 of equity and therefore an unnecessary adjustment.

366

**V. COMPARABLE COMPANIES**

367 **Q. MR. MEREDITH AND MR. BREVITZ MAKE A POINT THAT**  
368 **CHOOSING THE CORRECT COMPANIES IS VITAL WHEN**  
369 **DETERMING CAPM, DO YOU AGREE?**

370 A. Yes. For the CAPM model it is important to get comparable companies when  
371 calculating a beta. The integrity of the model relies on the comparable  
372 companies accurately reflecting the subject company.

373 **Q. CAN YOU EXPLAIN WHY YOU SELECTED THE COMPANIES YOU**  
374 **DID FOR YOUR CAPM CALCULATION?**

375 A. Yes. The starting point was to use as many of the same companies as were  
376 used in Docket No. 08-046-01 because the Commission found that the  
377 Division's calculation produced fair and reasonable rates. Eight of the  
378 companies listed were used in both Manti and Carbon. Those companies are:

- 379           ▪ Alaska Communications
- 380           ▪ Consolidated Communications
- 381           ▪ Frontier Communications
- 382           ▪ IDT Corp
- 383           ▪ Hickory Tech Corp
- 384           ▪ Otelco
- 385           ▪ Shenandoah Telecom
- 386           ▪ Windstream Corp.

387 The different companies I added for this Docket were:

- 388           ▪ Atlantic Tele-Network, Inc.
- 389           ▪ Cincinnati Bell Inc.
- 390           ▪ Alteva, Inc
- 391           ▪ Earthlink Holdings Corp.

392                   ▪ Fairpoint Communications, Inc.  
393           I selected these additional companies increase the number of companies to  
394           calculate an average beta that would get reasonable results. I specifically  
395           excluded large phone companies like AT&T, CenturyLink, and Verizon  
396           because they were vastly different than rural phone companies in Utah.  
397           Generally, I tried to find companies that had services and customers in some  
398           parts of the United States that would be considered rural.

399   **Q.   SO THE DIVISION HAS THEIR LIST, MR. MEREDITH HAS HIS**  
400   **QUESTIONS WITH COMPANIES ON THE LIST, MR. BREVITZ ALSO**  
401   **EXPRESSED A VARIETY OF RESERVATIONS. DO YOU THINK**  
402   **THEIR CONCERNS ARE VALID?**

403   **A.**   Yes, but for the entirely wrong reasons. In lines 230 – 235 Mr. Meredith  
404           argues “the CAPM is very sensitive to the selected peer group of publicly  
405           traded companies. The CAPM methodology assigns a risk premium based on  
406           this peer group to calculate a return on equity. So, the selection of similarly  
407           situated companies to be used for comparison is very important. Mr.  
408           Coleman uses 13 companies in his peer group. Examining this peer group  
409           shows serious problems that should give the Commission reservations in  
410           using his peer group.” Mr. Brevitz in lines 157 – 159 of his testimony argues  
411           that the “inclusion of additional ‘comparable companies’ should be considered  
412           on well founded criteria.” Each party that discusses the comparable

413 companies agree the peer group is vital for effectively determining the  
414 appropriate risk premium. Unfortunately, Mr. Meredith and Mr. Brevitz are  
415 silent on the most important fact in dealing with the selected peer group:  
416 very few, if any of the companies selected, have a state USF that will  
417 compensate those companies for operating in high cost areas of the country.  
418 As an example CenturyLink, as suggested by Mr. Brevitz offers service in at  
419 least 35 states in the country. CenturyLink is eligible for state USF funds in  
420 some of those states like Colorado, but does not qualify for any USF funds  
421 here in Utah. Obviously, companies like AT&T and Verizon may not be  
422 participating in reimbursements from a state USF fund.

423 **Q. WHY DOES THE DIVISION BELIEVE IT IS SUCH AN IMPORTANT**  
424 **POINT THAT MOST COMPANIES ARE NOT PARTICIPATING IN A**  
425 **STATE USF FUND WHEN CALCULATING THE COST OF CAPITAL**  
426 **FOR SMALL RURAL PHONE COMPANIES IN UTAH?**

427 A. As argued by Mr. Meredith and Mr. Brevitz finding the correct comparable  
428 companies is vital to having an accurate CAPM. Because most of the  
429 companies do not have state USF funds, the CAPM calculation is probably  
430 overestimating the appropriate cost of equity. The companies used as  
431 comparable companies are “riskier” investments because they do not have  
432 the USF funds. Because each company is riskier, one would logically believe  
433 the cost of equity for rural phone companies in Utah should be adjusted down

434 from a CAPM calculation. The risk or opportunity cost is sufficiently lower  
435 and as a result the required rate of return for investors would be less.

436 When calculating the cost of equity for the UUSF, when revenues are  
437 received from government funds, the equity received from those funds should  
438 have a zero cost. There is no risk with those revenues, and no traditional  
439 financial costs that should be considered. If the revenues received were from  
440 state of federal universal service funds then the cost should be zero, if rural  
441 phone companies used traditional methods of raising capital, i.e., stocks,  
442 bonds, etc. the cost of equity would be higher than zero to reflect a fair rate  
443 of return that would compensate investors for the risk of investing.

444 **Q. BECAUSE OF ALL THE REASONS LISTED ABOVE IT SEEMS LIKE**  
445 **YOU ARE NOT REAL FOND OF CAPM, COULD YOU ILLUSTRATE**  
446 **WHY YOU STILL BELIEVE IT IS THE APPROPRIATE METHOD TO**  
447 **USE?**

448 A. Yes. Because of the challenges and lack of reality in using CAPM for small  
449 rural phone companies, the redeeming value for this method is the end  
450 results. The true test of the CAPM is whether the model possesses  
451 explanatory power and forecasting ability. According to the “end result”  
452 doctrine used in basic regulatory rate making a model should be judged by

453 its ability to predict and explain rather than the robustness of its  
454 assumptions.

455 When setting rates and determining the appropriate cost of equity for small  
456 rural phone companies, the Commission must use some method. Every  
457 financial model has problems, but CAPM is the one method where  
458 interested parties can use publicly available data to determine what the  
459 allowed rate of return should be on the rate base of subject utilities. Using  
460 the textbook CAPM calculation gets us in the pasture for the correct cost of  
461 equity, which with the limited publicly traded information is as exact as can  
462 be hoped for. Furthermore, using a text-book approach to calculating  
463 CAPM minimizes the use of additional financial assumptions that could  
464 undermine the credibility of a fair and reasonable cost of equity, allowing  
465 the Commission some level of comfort that calculated rates will be sufficient  
466 to attract the necessary capital.

467 CAPM has issues, but adjusting the rate of return further increases the  
468 challenges of the model. Instead of making it easier to fit the square peg into  
469 the round hole, modifying the calculation makes the peg even more square  
470 and the hole even rounder.

471 **VI. ACCESS TO CAPITAL**

472 **Q. YOUR TESTIMONY JUST DISCUSSED ACCESSING FUNDS FROM**  
473 **EITHER THE BOND OR STOCK MARKET AS AN IMPORTANT**  
474 **ASSUMPTION OF THE FINANCIAL THEORIES. HAS CARBON**  
475 **USED THE TRADITIONAL MARKETS TO RAISE CAPITAL?**

476 A. I do not believe Carbon has used the traditional financial methods to raise  
477 capital. In reviewing the annual reports of Carbon filed with the Commission  
478 from 2008 until the latest annual report filed with the Commission, Carbon  
479 has reported additional capital expenditures for each year. In a data request  
480 to Carbon, the Division asked for information showing any instance where  
481 Carbon issued bonds or stocks to cover these capital expenditures. In  
482 Carbon's response they state "[s]mall privately owned and cooperative  
483 carriers, such as Carbon obtain funds to invest in critical infrastructure  
484 largely through boutique bank loans, grants, and federal support. In  
485 addition, capital is raised through retained earnings from services that are  
486 purchased by carriers and end-user customers." Although no specifics were  
487 provided by Carbon, the Division believes that no debt or stock was used to  
488 finance these capital improvements. It appears that Carbon used either  
489 retained earnings or cash flow from operations to finance these capital  
490 expenditures.

491 **Q. WHY IS IT IMPORTANT THAT CARBON IS NOT USING ISSUING OF**  
492 **STOCK OR BONDS TO FINANCE CAPITAL EXPENDITURES?**

493 A. If Carbon is not using stocks or bonds to finance its capital needs, those  
494 revenues must be coming from operations, retained earnings, or other  
495 sources of capital. If the capital expenditures are covered by operations, that  
496 means each customer or rate payer is financing the capital improvements.  
497 Instead, if the capital costs are covered by retained earnings the financing is  
498 from a blend of rate payers and USF funds. Finally, one of the other sources  
499 of capital for small rural phone companies is the government subsidy for high  
500 cost loop support. The Division believes one of the main sources of revenue  
501 for the capital expenditures for Carbon is the monies received from the  
502 Federal and State Universal Service Funds.

503 **Q. UNIVERSAL SERVICE FUNDS ARE SUPPOSED TO BE USED FOR**  
504 **HIGH COST SUPPORT AND CAPITAL IMPROVEMENTS, RURAL**  
505 **UTAH PHONE COMPANIES ARE USING THE MONEY AS**  
506 **CONTEMPLATED, SO WHY DOES IT MATTER IF USF FUNDS ARE**  
507 **PART OF RETAINED EARNINGS?**

508 A. The Division has no problem with the basic tenets and purposes of USF. The  
509 problem surfaces when USF begins to blend with financial theory. I am  
510 unfamiliar with any model that adjusts or takes into consideration when the  
511 “investors” of capital are a government fund. As stated above and also argued  
512 by Mr. Meredith, Commissioners must set rates so that there is adequate  
513 capital that will flow to small rural phone companies. If Carbon has not

514 issued any stock or bonds to finance capital expenditures it appears capital  
515 is flowing to Carbon. If, as financial theory supposes, investors are risk-  
516 averse, capital should be flowing to rural phone companies in Utah because  
517 the perceived risk of investing is offset and minimized by a government fund  
518 that compensates companies for many of the business risks they face.  
519 Finally, it is important to consider where Carbon gets its financing for capital  
520 because of the opportunity cost assumption with investing. If a government  
521 fund is providing a bulk of the capital for Carbon, is there any delayed  
522 consumption for that fund and therefore an appropriate rate that should  
523 apply? Is there reduced risk to traditional investors because of a state USF  
524 that effectively lowers Carbon's cost of capital? Given these various  
525 questions and uncertainties the Commission should use a CAPM model  
526 without additional adjustments, recognizing it as an imperfect tool.

527

**VII. HYPOTHETICAL CAPITAL STRUCTURE**

528

**Q. MR BREVITZ DISCUSSES THE REASONS THAT A HYPOTHETICAL  
CAPITAL STRUCTURE OF 35 DEBT AND 65 EQUITY IS NOT  
APPLICABLE IN THIS CASE, DO YOU AGREE?**

529

530

531

A. No. The whole premise of Mr. Brevitz's argument seems to stem from a memo from the commission that explicitly rejected the proposed "Capital Structure Rule". As discussed in Mr. Duncan's and Mr. Meredith's rebuttal testimony there were a number of factors involved in developing the policy that is applied by the Division in rate cases. While it is accurate to suggest that the Commission was uncomfortable in having a formal rule to determine the hypothetical capital structure, it is also accurate to point out that the Commission has approved numerous rate cases where the Commission accepted the Division's policy of using at 65/35 hypothetical capital structure.

532

533

534

535

536

537

538

539

540

In the above mentioned docket 08-046-01 no parties disputed the use of a hypothetical capital structure, and the Commission accepted the hypothetical capital structure as producing fair and reasonable rates.

541

542

543

The irony of this is that the OCS was approved using a hypothetical capital structure when the company was highly leveraged and financed almost entirely by debt. Now, the OCS argues that a 65/35 capital structure is

544

545

546 unreasonable and must be adjusted to better reflect what is appropriate for  
547 a small rural phone company.

548 **Q. THERE SEEMS TO BE A FAIR AMOUNT OF DISCUSSION OF THE**  
549 **MERITS OF USING A HYPOTHETICAL CAPITAL STRUCTURE. IS**  
550 **THERE ANOTHER OPTION BESIDES A HYPOTHETICAL CAPITAL**  
551 **STRUCTURE?**

552 A. Yes. The best scenario when calculating the cost of equity for rate of return  
553 regulated companies who receive USF funds would be for the Commission to  
554 develop an optimal capital structure for small rural phone companies. If the  
555 Commission were to develop the optimal capital structure the Division would  
556 then be able to use this capital structure when calculating the allowed return  
557 for companies. An optimal capital structure would give clear signals to  
558 companies as to the level of debt and equity the Commission considers  
559 prudent for small rural phone companies.

560 Another benefit of an optimal capital structure is limited risk to citizens of  
561 Utah who pay into the USF. As demonstrated in this case, the capital  
562 structure can have an impact on the allowed rate of return. If a small rural  
563 phone company decides to use a capital structure that does not maximize the  
564 earnings of the company, rate payers may be exposed to higher USF  
565 surcharges because of this management decision. If the Commission sets an  
566 optimal capital structure this increased burden is reduced. Because a

567 company has the freedom to choose what capital structure it wants to develop  
568 for its company, it could still be 100 % equity if it is debt averse or a blend of  
569 debt and equity that is more objectively reasonable. Setting an optimal  
570 capital structure would signal the maximum equity threshold the  
571 Commission was going to reimburse to companies who are receiving USF.

572 **Q. IS THE DIVISION RECOMMENDING USING AN OPTIMAL**  
573 **CAPITAL STRUCTURE?**

574 A. No. As stated before, the Division is recommending the Commission use the  
575 same hypothetical capital structure with the sliding scale that has been used  
576 in other dockets. The Division is suggesting that if the Commission did not  
577 like a hypothetical capital structure and was uncomfortable using the actual  
578 capital structure of a company the best solution would be to calculate the  
579 optimal capital structure when receiving state USF funds.

580 **VIII. CONCLUSION**

581 **Q. WHAT IS THE DIVISION'S RECOMMENDATION FOR THIS PETITION?**

582 A. The Division recommends that the Commission use a 35 percent debt and 65  
583 percent equity hypothetical capital structure and an allowed rate-of-return of

584 9.85 percent. The updated calculations are provided with my testimony as DPU  
585 Exhibit 3.1 SR.

586 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

587 A. Yes it does.
